

# Product Data

## AQUAFORCE® 30XA080-500 Air-Cooled Liquid Chillers

80 to 500 Nominal Tons  
(265 to 1615 Nominal kW)

# AQUAFORCE®

AquaForce chillers were designed from the ground up to meet the efficiency demands of today and the future by providing premium air-cooled chiller packages for contractors, consulting engineers and building owners.

- Rotary screw compression
- R-134a HFC refrigerant
- Quiet AeroAcoustic™ fan system
- Novation® heat exchanger technology with microchannel coil
- Easy to use *ComfortLink*™ controls
- Optional integrated hydronic package

## Features/Benefits

**AquaForce 30XA chillers provide best full load and part load performance in a single chassis from 80 to 500 tons**

### Premium performance

Aqua series chillers are Carrier's most efficient air-cooled models. The AquaForce chiller is one of the most affordable air-cooled chillers to operate and maintain. The AquaForce chiller offers full load EER (Energy Efficiency Ratio) up to 10.9 and IPLV (Integrated Part-Load Value) up to 15.4 with Novation heat exchanger technology. High-efficiency rotary screw compressors with infinitely variable slide valves allow the chillers to exactly match actual load conditions, delivering exceptional part load performance. The AquaForce chillers deliver superior efficiency through the entire operating range to keep costs and demand charges down. This exceptional performance has a significant impact on energy savings and cost of ownership.

**ASHRAE  
90.1  
COMPLIANT**  
Well exceeds ASHRAE 90.1 Standards.

# Features/Benefits (cont)

## AquaForce® chillers' quiet operation make them ideal for sound sensitive applications

Great performance is delivered in a low sound unit that will be quiet enough for any application including hospitals, schools and other sites located in residential neighborhoods. The AquaForce chiller's AeroAcoustic™ fan is almost twice as quiet per cfm as the competition. In part load operation, such as cooler weather or night time duty, fewer fans operate. This results in even quieter operation.

## Built in reliability

AquaForce chillers were developed under one of the most exacting qualification programs ever used for commercial chiller products. The compressors are virtually maintenance-free and protected by an auto-adaptive control that minimizes compressor wear. Operate AquaForce chillers year-round from -20 F (-29 C) to 125 F (52 C), with a combination of options and control methods. The following features are also provided to help ensure reliable performance:

**Multiple independent circuits** provide redundancy and greater reliability.

**Electronic expansion valve (EXV)** allows for precise control through all operating ranges.

## Highly efficient, reliable chilled water circuit

AquaForce chillers provide a comprehensive chilled water circuit utilizing a high-efficiency shell-in-tube flooded cooler. Units are equipped with a drainable cooler.

**Electronic thermal-dispersion flow switch** is included with the cooler. The switch is factory installed and tested and contains no moving parts for high reliability.

## Environmentally sound

Refrigerant R-134a enables the user to make a responsible choice in helping to preserve the environment. Refrigerant R-134a is an HFC refrigerant that does not contain ozone-layer damaging chlorine. This refrigerant is unaffected by the Montreal Protocol. It is a safe, non-toxic\*, efficient and environmentally sound refrigerant.

## Easy installation

A single chassis design provides a one-piece unit from 80 to 500 tons. The base rail is industrial-quality cold-rolled steel for maximum structural integrity. The base rail is 1/4-in. with RTFP (round tube, plate fin) coils or 7 ga with MCHX (microchannel) coils. The zinc-dipped galvanized frame (with SermaGuard™ coated screws) provides the best protection on the market for corrosion resistance. With such a structurally sound base, no perimeter base rail is needed.

## ComfortLink™ controls for ease of use

The ComfortLink controls communicate in easy to understand English, making it as easy as possible to monitor and control each AquaForce chiller while accurately maintaining fluid temperatures. ComfortLink controls are available with French, Portuguese and Spanish as a standard configuration option. Carrier 30 Series chillers' ComfortLink controls provide features such as chilled water temperature reset, demand limiting, compressor wear minimization and protection, temperature and pressure displays and

diagnostic functions. These controls result in higher chiller reliability, simplified training and more productive service calls with correspondingly lower operational and maintenance costs.

Two user interface options are available, the Touch Pilot™ display and the Navigator™ module. The Touch Pilot display is an easy to use touch screen display that provides simple navigation for configuration and control of AquaForce units.

Carrier's exclusive handheld Navigator display provides convenience and powerful information in the palm of your hand. The Navigator display helps technicians to quickly diagnose problems and even prevent them from occurring. All AquaForce units are ready to be used with Carrier Comfort Network® (CCN) devices.

## Novation® heat exchanger technology

The Novation heat exchanger design with microchannel (MCHX) condenser coil is a robust, cost effective alternative to traditional coil design. These coils are offered coated or uncoated to match coil protection to site conditions. The Carrier Electronic Catalog (E-Cat) can be used to determine whether or not corrosion protection is recommended for particular applications in coastal/marine environments. Following the input of the requested data, the E-Cat program output will advise the appropriate coil to be used. Other factors described in "Selection Guide: Environmental Corrosion Protection, Novation Heat Exchanger with Microchannel Coil Technology" catalog number 04-581042-01 must also be considered to determine if corrosion protection is required.

Microchannel coils are sturdier than other coil types, making them easier to clean without causing damage to the coil.

Due to the compact all aluminum design, microchannel coils will reduce overall unit operating weight by 6 to 7%. The streamlined MCHX coil design reduces refrigerant charge by up to 30%.

The coil is designed with rubber isolation around the powder painted coil frame to eliminate galvanic couples which can cause corrosion due to dissimilar metals.

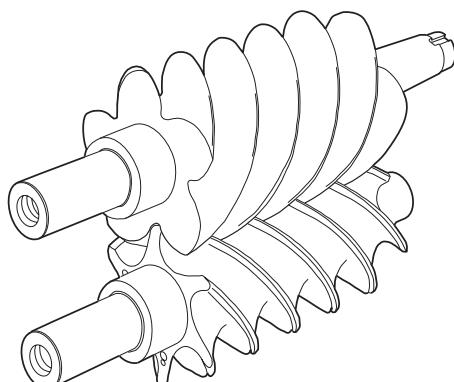

\*Under ASHRAE Standard 34-1992, R-134a is classified as an A1 refrigerant.

### LEGEND

- Cu** — Copper  
**AI** — Aluminum  
**EXV** — Electronic Expansion Valve  
**MCHX** — Microchannel Heat Exchanger  
**N/A** — Not Applicable

\*Operating weight includes 2 pumps on models 30XA090-160. No pumps are available on 30XA080 or 30XA180-500. All weights include coil trim panels. See pages 8-19 for mounting weights for units without pumps and units with single pump packages.

†30XA080 unit does not have an economizer.

\*\*The high ambient temperature option is not available on 30XA080-120 units.

## LEGEND

LON — Local Operating Network

## Factory-installed options

**Condenser coil** options are available to match coil construction to the site conditions for the best durability. Refer to the Condenser Coil Corrosion Protection Options table on page 22 or the appropriate selection guide for more information.

**High ambient temperature option** provides high-speed condenser fan motors to increase the condenser airflow. This option may allow for an increase in machine capacity, and may also result the selection of a smaller chassis to meet given capacity requirements. The high ambient temperature option is not available on 30XA080-120 units. This option is required for 30XA400-500 units which are either operating in multi-chiller configurations or have ambient temperatures at or above 100 F (37.8 C).

**Minus-one-pass cooler** provides a lower pressure drop through the cooler for applications with low delta T

(temperature) or high flow or where the coolers are piped in a series arrangement.

**Plus-one-pass cooler** provides a greater efficiency for brine applications and in applications with a high delta T and low flow.

**Wye-delta start** is an alternate starting method which reduces the in-rush current when starting the compressor.

**Compressor suction service valve** provides additional protection. Standard refrigerant discharge isolation and liquid valves enable service personnel to store the refrigerant charge in the cooler or condenser during servicing. This factory-installed option allows for isolation of the compressor from the cooler vessel.

**Energy management module** provides energy management capabilities to minimize chiller energy consumption. Several features are provided with this module including leaving fluid temperature reset, cooling set point or demand limit control from a 4 to 20 mA signal, space

temperature reset (requires field-installed space temperature sensor), 2-step demand limit control (from 0 to 100%) activated by a remote contact closure, and discrete input for "Ice Done" indication for ice storage system interface.

**Service option** provides a remote service port for Navigator™ display connection (sizes 080-120, not required on other sizes) and a factory-installed convenience outlet that includes 4-amp GFI (ground fault interrupt) receptacle. Convenience outlet is 115-v female receptacle. Service option not available with 380-v units, and is also available as a field-installed accessory.

**Low ambient temperature head pressure control** permits operation of the 30XA units to -20 F (-29 C) outdoor ambient temperature. The control is also available as a field-installed accessory and may require field-installed wind baffles.

**Medium temperature brine** option allows for leaving fluid temperatures to be set below 30 F (-1.1 C). The lowest allowable leaving fluid temperature is a function of brine type. Further when this option is employed, machine parameters and operating conditions are a function of chiller size as well as brine type. Low ambient temperature head pressure control and suction line insulation are required when the medium temperature brine option is installed. This option is available on sizes 080-350 only.

The chart below shows the parameters associated with medium temperature brine applications.

PARAMETER	30XA SIZES	BRINE TYPE	
		EG	PG
Cooler Passes	080-350	3 (or +1)	3 (or +1)
Minimum Leaving Fluid Temperature	080-350	21.2 F	26.6 F
Maximum Glycol	080-350	35%	33%
Allowable Cooler Delta Temperature*	080-090	2.0 to 7.2 delta F	2.0 to 5.4 delta F
	100-350	2.0 to 7.2 delta F	2.0 to 7.2 delta F

#### LEGEND

**EG** — Ethylene Glycol  
**PG** — Propylene Glycol

\* Leaving fluid temperature less than 32 F (0° C).

**Unit-mounted non-fused disconnect** option provides non-fused disconnect for unit power located at the unit.

**Suction line insulation** is tubular closed-cell insulation. This option is required with the medium temperature brine option and recommended for areas of high dewpoints where condensation may be a concern.

**BACnet™ translator control** provides an interface between the chiller and a BACnet Local Area Network (LAN, i.e., MS/TP EIA-485). The BACnet translator control is also available as a field-installed accessory.

**LON translator control** provides an interface between the chiller and a Local Operating Network (LON, i.e., LonWorks FT-10A ANSI/EIA-709.1). The LON translator control is also available as a field-installed accessory.

**Condenser coil trim panels** provide an aesthetic, finished appearance for the condenser coil ends of the compressor side of the unit. Condenser coil trim panels are also available as a field-installed accessory.

**Control transformer** is sized to supply the needs of the control circuit from the main power supply.

**Hydronic pump package** adds circulating pumps, a combination valve (isolation, modulation and check), strainer, victaulic piping connections, insulation and heaters and pressure temperature taps (3). The pumps are available in single or dual (lead/lag controlled), cooler pump versions with total dynamic head external to the chiller from approximately 20 to 140 ft (6.1 to 42.7 m). The hydronic pump package is only available for unit sizes 30XA090-160.

**Security grilles** are coated grilles that protect the condenser, cooler and compressors. These are also available as an accessory.

**Upper hail guard** consists of louvered panels on the ends of the machine, which firmly fasten to the machine frame and provide coverage from the top of the unit to the bottom of the coil. A hinged accessory hail guard is also available. The accessory covers the entire unit end (both ends), and, with its hinged design, is not identical to this option.

**Full end screen** consists of louvered panels on the ends of the machine, providing complete coverage from the top to the bottom of the unit. This option functions as both a privacy screen and a hail guard. For hail protection, an accessory hail guard is also available. The accessory covers the entire unit end (both ends), and, with its hinged design, is not identical to this option.

**Compressor enclosures** provide sound reduction for the screw compressors.

**Navigator™ module** provides a portable, hand-held display for convenient access to unit status, operation, configuration and troubleshooting diagnostics capability.

**Touch Pilot™ display** provides a touch screen user interface. This fixed screen display can be used to commission, monitor and control Carrier Comfort Network® devices. It provides access to configuration, maintenance, service, set point, time schedule, alarm history and status data.

#### Field-installed accessories

**Touch Pilot display** used as an accessory is a cost-effective, touch-screen, remote mount device that can be used in lieu of the remote enhanced display.

**Remote enhanced display** is a remotely mounted indoor 40-character per line, 16-line display panel for unit monitoring and diagnostics.

**Remote cooler kit** allows for remote installation of the cooler. Never bury refrigerant lines when using this accessory or in any other application.

**Chillervisor System Manager III multi-unit control** allows sequencing of between two and eight chillers in parallel.

**Low ambient temperature head pressure control** permits operation of the 30XA units to -20 F (-29 C) outdoor ambient temperature. The control is also available as a factory-installed option and may require field-installed wind baffles.

**Energy management module** provides energy management capabilities to minimize chiller energy consumption.

# Options and accessories (cont)

Several features are provided with this module including leaving fluid temperature reset, cooling set point, space temperature reset (requires field-installed space temperature sensor) or demand limit control from a 4 to 20 mA signal, 2-step demand limit control (from 0 to 100%) activated by a remote contact closure (one-step demand limit does not require the energy management module), and discrete input for "Ice Done" indication for ice storage system interface.

**Remote service port** consists of a receptacle for Navigator device connection. The port is housed in a waterproof enclosure conveniently located for easy access to information during operation and maintenance routines.

**Navigator™ module** is required when there is a need for a portable hand-held display, and the main display is a Touch Pilot™ display.

**Convenience outlet** includes 4-amp GFI (ground fault interrupt) receptacle. Convenience outlet is 115-v female receptacle. Not available with 380-v units.

**BACnet™ translator control** provides an interface between the chiller and a BACnet Local Area Network (LAN, i.e., MS/TP EIA-485). The BACnet translator control is also available as a factory-installed option.

**LON translator control** provides an interface between the chiller and a Local Operating Network (LON, i.e.,

LonWorks FT-10A ANSI/EIA-709.1). The LON translator control is also available as a factory-installed option.

**Condenser coil trim panels** provide an aesthetic, finished appearance for the condenser coil ends of the compressor side of the unit. Condenser coil trim panels are also available as a factory-installed option.

**Full hail guard** consists of hinged, louvered panels, which cover both ends of the unit. This accessory provides complete protection from hail and flying debris. For hail protection, two factory options are also available. These options directly fasten to the end of the chillers (are not hinged), and therefore are not identical to this accessory.

**Minimum load control** allows additional capacity reduction for unit operation below the minimum step of unloading via hot gas bypass.

**External pump control** allows the chiller to control dual, external pumps. This accessory is not required for single, external pumps or factory-installed pumps.

**Security grilles** are coated grilles that protect the condenser, cooler, and compressors. These are also available as a factory-installed option.

**Dual chiller accessory kit** provides the additional hardware (thermistors, wells, connectors) required for applications with 2 chillers running in parallel.

## 30XA180,200

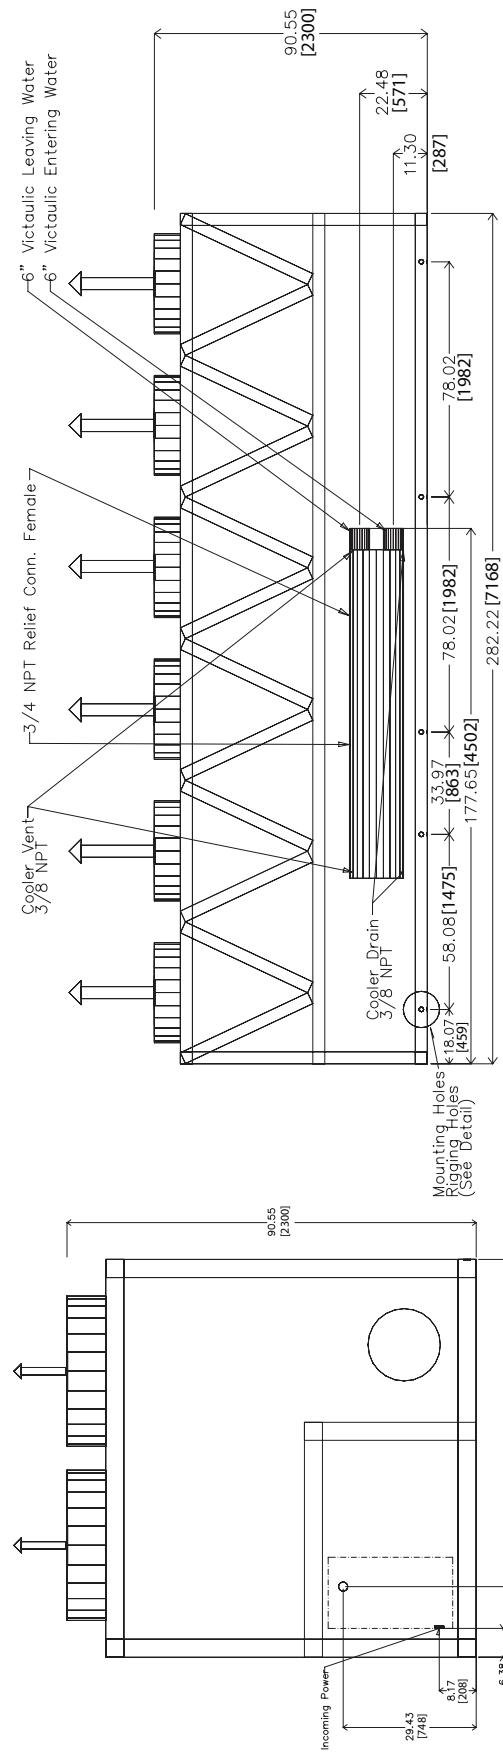

### NOTES:

1. Unit must have clearances as follows:
  - Top — Do not restrict
  - Sides and Ends — 6 ft (1.8 m) from solid surface.
2. Temperature relief devices are located on liquid line and economizer assemblies and have 1/4-in. flare connection.
3. 3/8-in. NPT vents and drains located in each cooler head at each end of cooler.
4. Drawing depicts unit with single point power, standard two-pass cooler, and a nominal voltage range of 380 to 575 V. Refer to the Packaged Chiller Builder program for other configurations.
5. Dimensions are shown in inches. Dimensions in [ ] are in millimeters.

# Selection procedure

Carrier's Packaged Chiller Builder Selection Program provides quick, easy selection of Carrier's air-cooled liquid chillers. The program considers specific temperature, fluid and flow requirements among other factors such as fouling and altitude corrections.

Before selecting a chiller, consider the following points:

## Leaving water temperature (LWT)

- If the LWT is less than 40 F (4.4 C), loop freeze protection to a minimum of 15° F (8.3° C) below the LWT set point is required. The medium temperature brine option is also required.
- If the LWT requirement is greater than 60 F (15.5 C), a mixing loop is required.

## Entering water temperature (EWT)

- If the EWT requirement is greater than 70 F (21.1 C), a mixing loop is required. The EWT should not exceed 70 F (21.1 C) for extended operation. Pulldown can be accomplished from 95 F (35 C).

## Cooler flow rate or cooler delta-T:

- The cooler delta-T (EWT – LWT) must fall between 5 and 20° F (2.8 to 11.1° C) while still meeting the maximum entering requirements.
- For larger or smaller delta-T applications, a mixing loop is required.
- If the cooler flow is variable, the rate of change of flow should not exceed 10% per minute. A loop volume of greater than 3 gallons per ton (3.2 l/kW) is also recommended.

## Cooler pressure drop:

- A high cooler pressure drop can be expected when the cooler delta-T is low. A mixing loop can help to alleviate this situation.
- Alternatively, consider a reduced pass option when there is a low delta-T.
- A low cooler pressure drop can be expected when cooler delta-T is high.
- The plus-one-pass cooler option is recommended to increase performance when cooler delta-T is high. This is particularly helpful with brine applications.

## Water quality, fouling factor:

- Poor water quality can increase the required cooler fouling factor.
- Higher than standard fouling factors lead to lower capacity and higher input kW from a given chiller size compared to running the same application with better quality water (and lower fouling factors).

## Operation below 32 F (0° C) ambient temperature:

- Low ambient temperature head pressure control is required.

- Consider wind baffles if average wind speed is greater than 5 mph (8 km/h).
- Consider higher loop volumes, 6 to 10 gallons per nominal ton (6.5 to 10.8 l/kW).
- Loop freeze protection with glycol is strongly recommended to a minimum of 15° F (8.3° C) below lowest anticipated ambient temperature.
- Chilled water pump control is strongly recommended; otherwise override capability is required.

## Chiller idle below 32 F (0° C) ambient temperature:

- Loop freeze protection with glycol is strongly recommended to a minimum of 15° F (8.3° C) below lowest anticipated ambient temperature.
- Chilled water pump control is strongly recommended; otherwise override capability is required.
- Drain the cooler — This will require a small amount of glycol for residual water. Cooler heaters will need to be disconnected.
- Consider using a remote cooler. Do not bury refrigerant piping.

## Ambient Temperature:

- Highest allowable ambient air temperature is 125 F (52 C).

NOTE: The high ambient option is required for 30XA400-500 chillers which are either operating in multi-chiller configurations or have ambient temperatures at or above 100 F (37.8 C). Regardless of unit size, it may be necessary to select the high ambient option to obtain performance with ambient air temperatures approaching 125 F (52 C).

## Cooling capacity requirement:

- Do not oversize the chillers by more than 15% at design conditions.
- If capacity control is required below the standard minimum step of unloading, the minimum load control option should be employed. (See selection program.)

## Coil corrosion requirements:

- Coastal application
- Industrial application
- Coastal/industrial application
- Urban application
- Farming

NOTE: See NACO Packaged Chiller Builder and appropriate selection guides for more information.

## Temperature reset:

- Return water (standard)
- Outside air temperature (standard)
- Space temperature (accessory sensor required)
- 4 to 20 mA (requires an energy management module)

## Demand limit:

- 2-step (requires an energy management module)
- 4 to 20 mA (requires an energy management module)
- CCN Loadshed

To select a 30XA chiller, use the Packaged Chiller Builder Selection program or follow one of the procedures below.

## ENGLISH

### I Determine 30XA unit size and operating conditions required to meet given capacity at given conditions.

Given:

Capacity . . . . . 106 Tons  
Leaving Chilled Water Temp (LCWT) . . . . . 42 F  
Cooler Water Temp Rise . . . . . 10° F  
Condenser Entering Air Temp . . . . . 95 F  
Fouling Factor (Cooler) . . . . 0.00010 (ft<sup>2</sup> · hr · F/Btu)

NOTE: For other than 10° F temperature rise, data corrections must be made using the Packaged Chiller Builder Program.

### II From Chiller Ratings table on page 56 and pressure drop curves on page 55, determine operating data for selected unit.

Unit . . . . . 30XA120  
Capacity . . . . . 107.5 tons  
Power Input . . . . . 126.7 kW  
Cooler Water Flow . . . . . 257.0 gpm  
Cooler Pressure Drop . . . . . 12.0 ft of water

## SI

### I Determine 30XA unit size and operating conditions required to meet given capacity at given conditions.

Given:

Capacity . . . . . 450 kW  
Leaving Chilled Water Temp (LCWT) . . . . . 6 C  
Cooler Water Temp Rise . . . . . 5.6° C  
Condenser Entering Air Temp . . . . . 35 C  
Fouling Factor (Cooler) . . . . . 0.0176 (m<sup>2</sup> · °C/W)

NOTE: For other than 5.6° C temperature rise, data corrections must be made using the Packaged Chiller Builder Program.

### II From Chiller Ratings table on page 58 and cooler pressure drop curves on page 55, determine operating data for selected unit.

Unit . . . . . 30XA140  
Capacity . . . . . 458.1 kW  
Power Input . . . . . 147.5 kW  
Cooler Water Flow . . . . . 19.7 l/s  
Cooler Pressure Drop . . . . . 41.9 kPa

## AquaForce® pump selection

Several pump sizes are available for each AquaForce chiller size to provide flexibility in matching water system requirements. A dual pump option is also available for primary/standby operation. The Carrier Packaged Chiller Builder Selection Program can be used (and is recommended) for pump selection, or selection can be done manually.

Proper water system design is critical; cooling loads, water pressure drops and proper water line sizing must be accounted for in order to ensure proper system operation. Incorrect or incomplete analysis/design of the water loop could lead to low water flow, loss of water temperature control, and excessive cycling of chiller compressors.

The following are the steps for manual selection of water pumps for the 30XA chillers (refer to Pump Curve Hydronic Package tables).

1. Calculate the water flow rate (gpm or l/s) and the total water (or brine) pressure drop of the system external to the 30XA chiller.
2. Use the pump envelope charts (page 52) to determine proper pump sizing. Plot water flow rate and total head, point on the chart. The next pump curve above this point corresponds to the correct pump.

NOTE: Although pump bhp (brake horsepower) increases with glycol concentration, pumps and pump overloads are selected such that glycol concentrations up to 50% will not trip pump overloads if run within the recommended gpm ranges.

**Example:** Required water flow rate for a 30XA090, chiller is 200 gpm (12.6 l/s). The pressure drop for the water system external to the chiller is 60 feet (179.4 kPa). The dual pump is needed. Select the pump.

After examining the dual pump charts for the 30XA090 and using the indicated flow rate and external pressure drop, select pump 8.

## PUMP IMPELLER SIZES

30XA UNIT SIZE	PUMP Hp	SINGLE PUMP				DUAL PUMP			
		Option Code*	Rpm	Impeller Dia. (in.)	Pump Curve	Option Code*	Rpm	Impeller Dia. (in.)	Pump Curve
090-160	5	1	3450	4.5	I	7	3450	4.5	II
	7.5	2	3450	5	I	8	3450	5	II
	10	3	3450	5.4	I	B	3450	5.4	II
	15	4	3450	6.1	I	C	3450	6.1	II

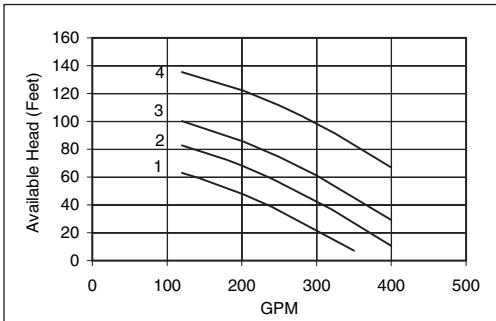

\*Option Code refers to the Hydronics Option (position 11) in the model number. See Model Number Nomenclature on page 4 for option identification.

### SINGLE PUMP ENVELOPE CURVES (30XA090-160)

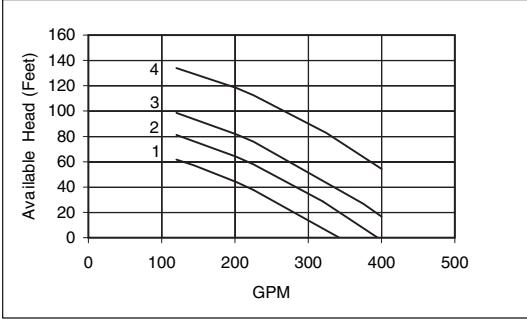

30XA090,100

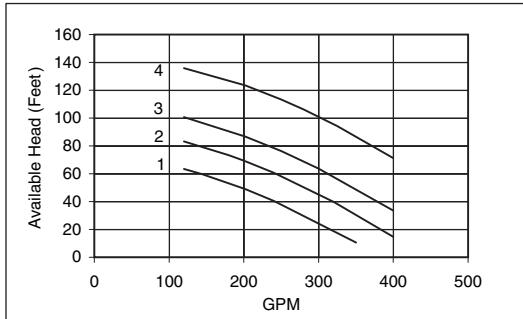

30XA140

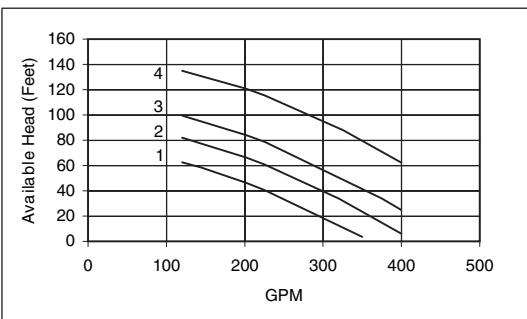

30XA110

30XA160

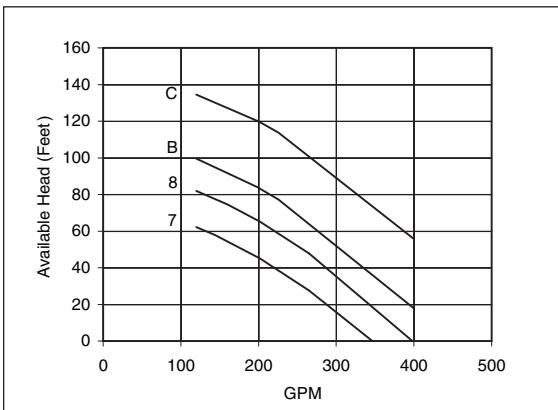

30XA120

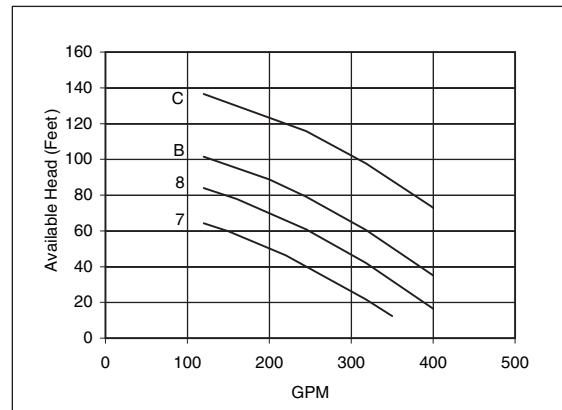

Selection	Pump
1	Single 5HP
2	Single 7.5HP
3	Single 10HP
4	Single 15HP

### DUAL PUMP ENVELOPE CURVES (30XA090-160)

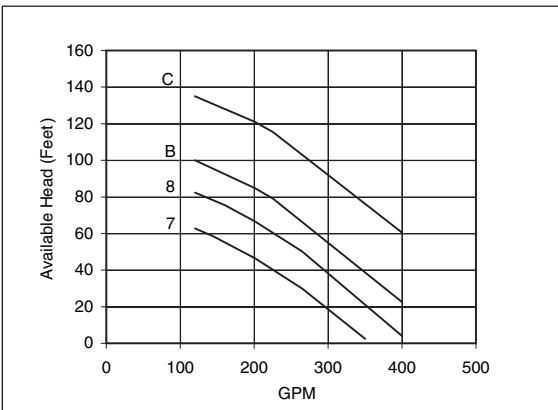

**30XA090,100**

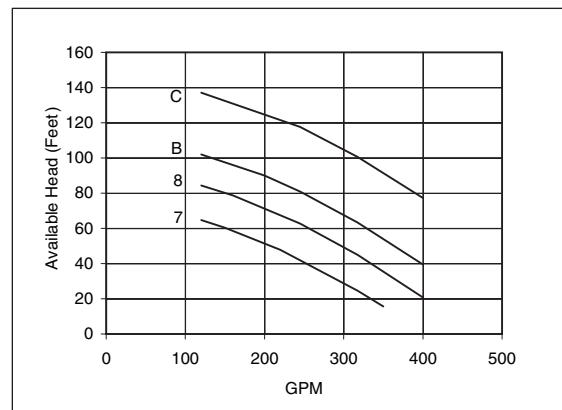

**30XA140**

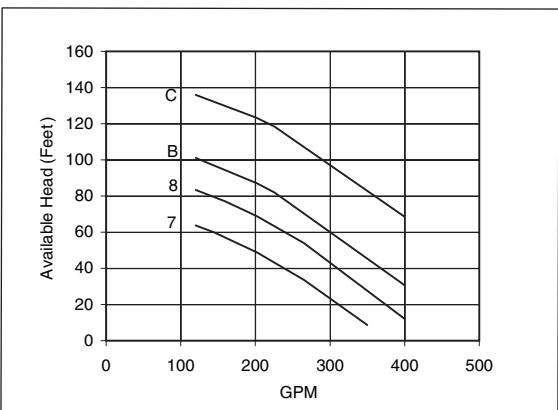

**30XA110**

**30XA160**

**30XA120**

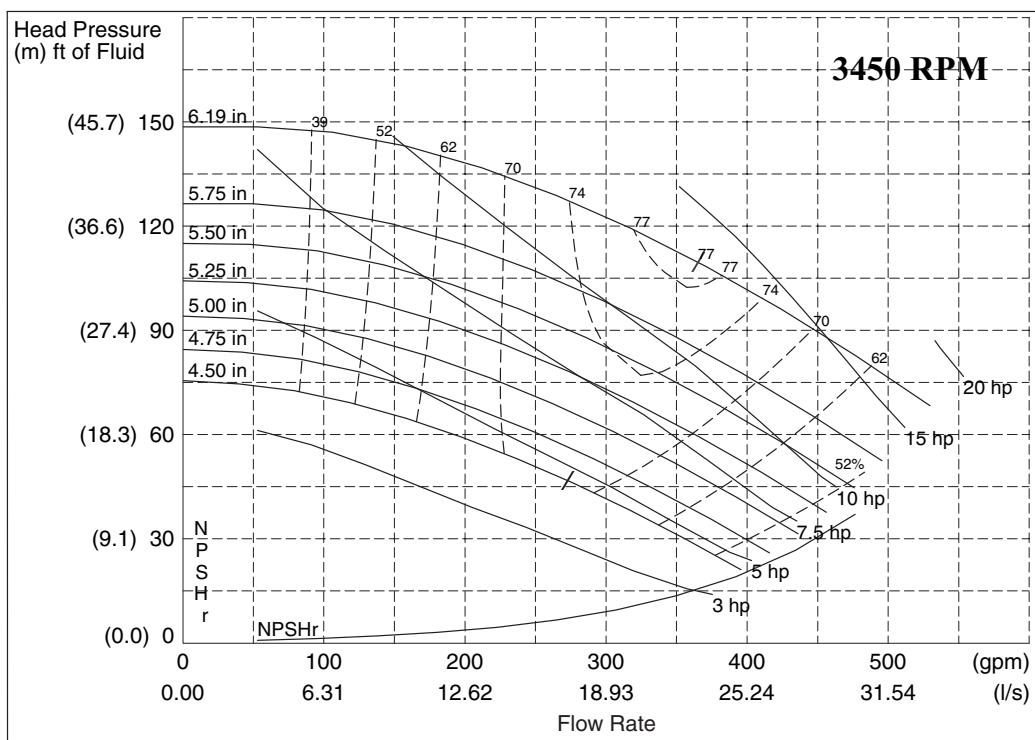

Selection	Pump
7	Dual 5HP
8	Dual 7.5HP
B	Dual 10HP
C	Dual 15HP

# Performance data (cont)

PUMP CURVE I FOR HYDRONIC PACKAGE SINGLE PUMP (FRESH WATER)

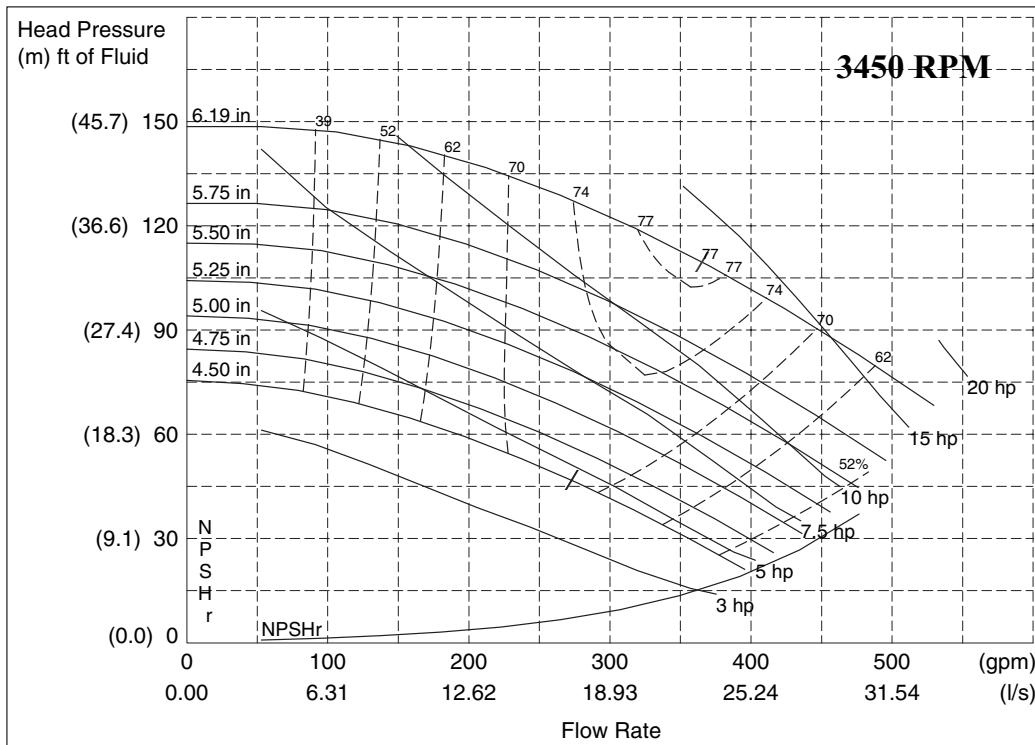

**LEGEND**

**NPSH<sub>r</sub>** — Net Positive Suction Head (Pressure) Required

NOTE: Refer to the Model Number Nomenclature for option identification. Refer to the Pump Impeller Sizes table on page 52 for more information.

PUMP CURVE II FOR HYDRONIC PACKAGE DUAL PUMP (FRESH WATER)

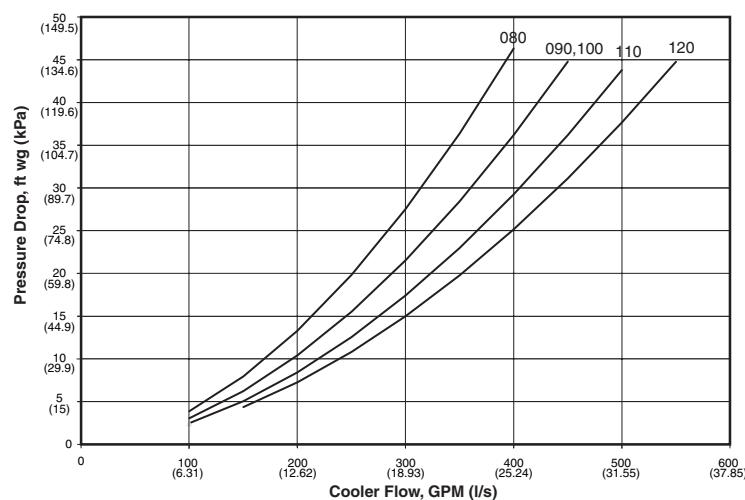

**LEGEND**

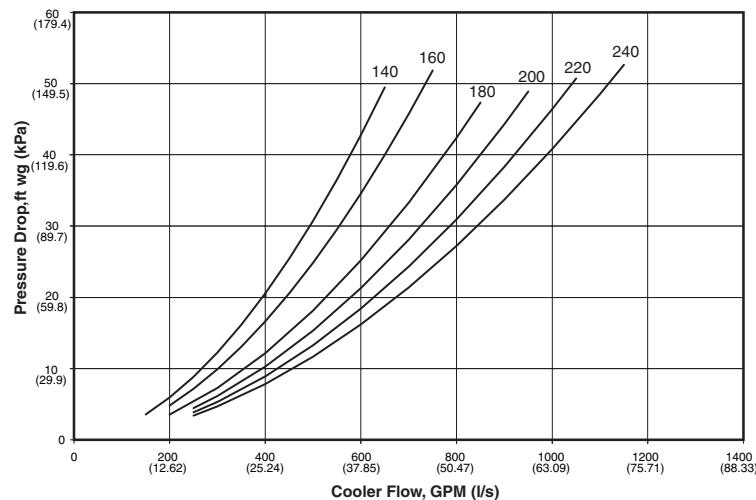

**NPSH<sub>r</sub>** — Net Positive Suction Head (Pressure) Required

NOTE: Refer to the Model Number Nomenclature for option identification. Refer to the Pump Impeller Sizes table on page 52 for more information.

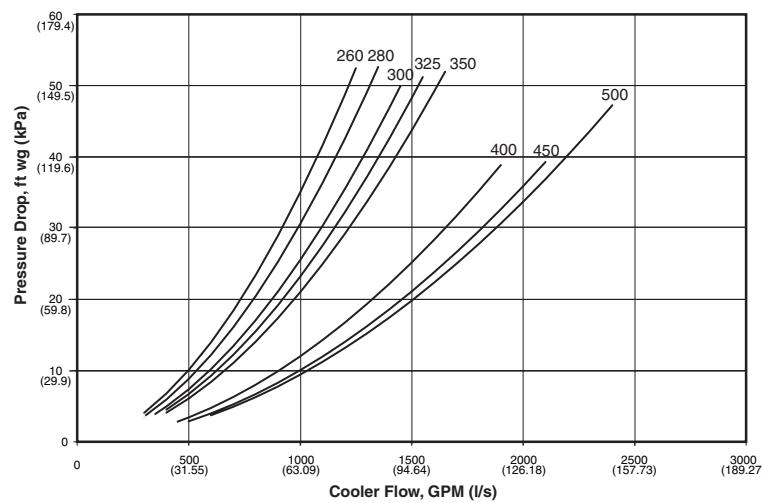

**COOLER PRESSURE DROP CURVES**  
**30XA080-120**

**30XA140-240**

**30XA260-500**

# Performance data (cont)

### LEGEND

Cap. — Cooling Capacity (Tons of Refrigeration)  
 kW — Total Power  
 LCWT — Leaving Chilled Water Temperature

### NOTES:

1. All ratings are in accordance with ARI (Air Conditioning and Refrigeration Institute, U.S.A.) Standard 550/590, based on:
  - a. A cooler water temperature rise of 10° F. For other than a 10° F temperature rise, data corrections must be made using the Packaged Chiller Builder Program.
  - b. A fouling factor of 0.00010 (ft<sup>2</sup> · hr · F/Btu) in the cooler.
  - c. Refrigerant 134a.
2. Ratings generated are based on standard ambient temperature (850 rpm condenser fan) units.
3. Data for 30XA450, 500, LCWT 50, Condenser Entering Air Temperature 115 F not available at time of printing.

LEGEND

Cap. — Cooling Capacity (Tons of Refrigeration)  
 kW — Total Power  
 LCWT — Leaving Chilled Water Temperature

NOTES:

1. All ratings are in accordance with ARI (Air Conditioning and Refrigeration Institute, U.S.A.) Standard 550/590, based on:
  - a. A cooler water temperature rise of 10° F. For other than a 10° F temperature rise, data corrections must be made using the Packaged Chiller Builder Program.
  - b. A fouling factor of 0.00010 (ft<sup>2</sup> · hr · F/Btu) in the cooler.
  - c. Refrigerant 134a.
2. Ratings generated are based on standard ambient temperature (850 rpm condenser fan) units.
3. Data for 30XA450, 500, LCWT 50, Condenser Entering Air Temperature 115 F not available at time of printing.

Cap. — Cooling Capacity (kW of Refrigeration)  
 kW — Total Power  
 LCWT — Leaving Chilled Water Temperature

NOTES:

1. All ratings are in accordance with ARI (Air Conditioning and Refrigeration Institute, U.S.A.) Standard 550/590, based on:
  - A cooler water temperature rise of 5.6° C. For other than a 5.6° C temperature rise, data corrections must be made using the Packaged Chiller Builder Program.
  - A fouling factor of 0.00018 (m<sup>2</sup> · °C/W) in the cooler.
  - Refrigerant 134a.
2. Ratings generated are based on standard ambient temperature (850 rpm condenser fan) units.

#### LEGEND

**Cap.** — Cooling Capacity (kW of Refrigeration)  
**kW** — Total Power  
**LCWT** — Leaving Chilled Water Temperature

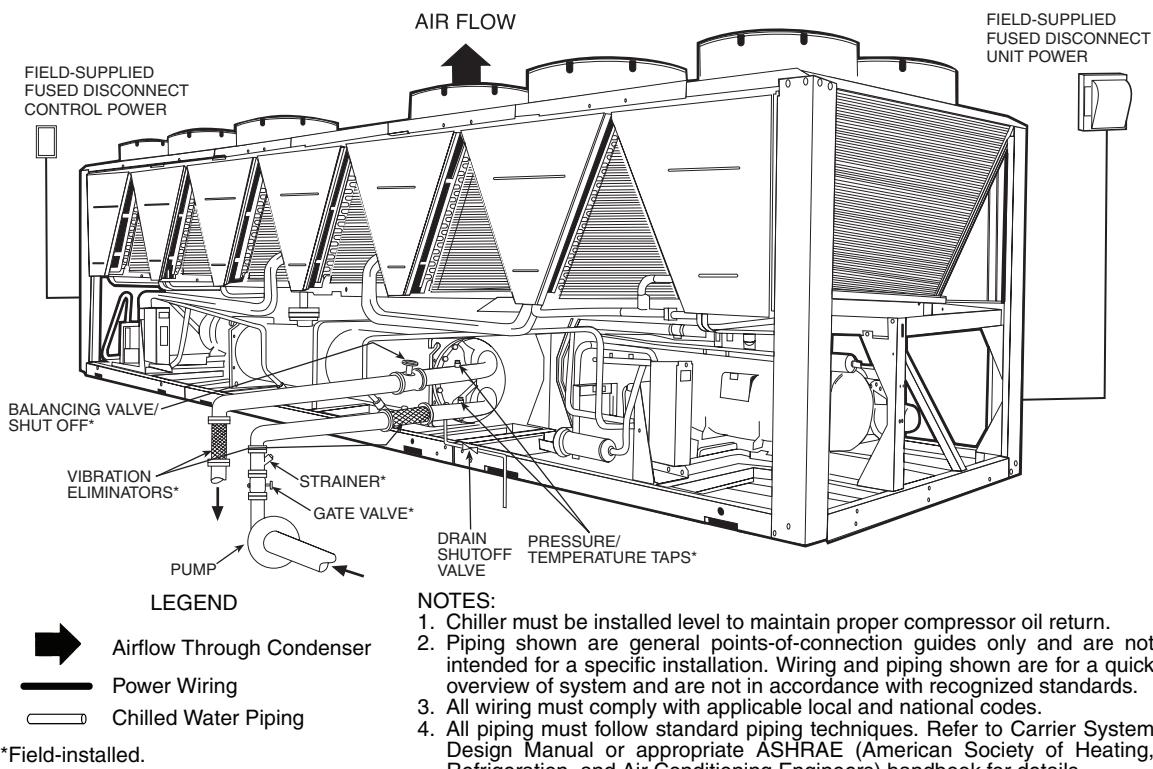

#### NOTES:

1. All ratings are in accordance with ARI (Air Conditioning and Refrigeration Institute, U.S.A.) Standard 550/590, based on:
  - a cooler water temperature rise of 5.6° C. For other than a 5.6° C temperature rise, data corrections must be made using the Packaged Chiller Builder Program.
  - b. A fouling factor of 0.00018 (m<sup>2</sup> · °C/W) in the cooler.
  - c. Refrigerant 134a.
2. Ratings generated are based on standard ambient temperature (850 rpm condenser fan) units.

### LEGEND

ICF — Instantaneous Current Flow  
 MCA — Minimum Circuit Amps  
 MOCP — Maximum Overcurrent Protection  
 WD — Wye-Delta  
 XL — Across-the-Line

\*30XA400-500 units are not available with single point power.

### NOTES:

- Units are suitable for use on electrical systems where voltage supplied to the unit terminals is not below or above the listed minimum and maximum limits. Maximum allowable phase imbalance is: voltage, 2%; amps 10%.
- Cooler heater is wired into the control circuit so it is always

## DUAL POINT (STANDARD CONDENSER FAN MOTORS)

## **Electrical data (cont)**

## **DUAL POINT (STANDARD CONDENSER FAN MOTORS) (cont)**

## LEGEND

**ICF** — Instantaneous Current Flow  
**MCA** — Minimum Circuit Amps  
**MOPC** — Maximum Overcurrent Protection  
**WD** — Wye-Delta  
**XL** — Across-the-Line

## NOTES:

1. Units are suitable for use on electrical systems where voltage supplied to the unit terminals is not below or above the listed minimum and maximum limits. Maximum allowable phase imbalance is: voltage, 2%; amps 10%.
  2. Cooler heater is wired into the control circuit so it is always operable as long as the control power supply disconnect is on, even if any safety device is open.
  3. For MCA that is less than or equal to 380 amps, 3 conductors are required.  
For MCA between 381-760 amps, 6 conductors are required.

For MCA between 761-1140 amps, 9 conductors are required.

For MCA between 1141-1520 amps, 12 conductors are required.

Calculation of conductors required is based on 75 C copper wire. With a conductor flexibility limit of 155 C, this will

4. Wiring for main field supply must be rated 75 C minimum. Use copper for all units.

  - Incoming wire size range for the terminal block is no. 4 AWG (American Wire Gage) to 500 kcmil.
  - Incoming wire size range of non-fused disconnect with MCA up to 599.9 amps is 3/0 to 500 kcmil.
  - Incoming wire size range of non-fused disconnect with MCA from 600 to 799.9 amps is 1/0 to 500 kcmil.
  - Incoming wire size range of non-fused disconnect with MCA from 800 to 1199.9 amps is 250 kcmil to 500 kcmil.

5. Data provided circuit 3 (circuit 2 where there are two circuits).

5. Data provided circuit 1/circuit 2 where there are two circuits.

**XL** — Across-the-Line

**NOTES:**

- Units are suitable for use on electrical systems where voltage supplied to the unit terminals is not below or above the listed minimum and maximum limits. Maximum allowable phase imbalance is: voltage, 2%; amps 10%.
- Cooler heater is wired into the control circuit so it is always operable as long as the control power supply disconnect is on, even if any safety device is open.
- For MCA that is less than or equal to 380 amps, 3 conductors are required.  
For MCA between 381-760 amps, 6 conductors are required.

- For MCA between 761-1140 amps, 9 conductors are required.
- For MCA between 1141-1520 amps, 12 conductors are required.
- Calculation of conductors required is based on 75 C copper wire.
  - Wiring for main field supply must be rated 75 C minimum. Use copper for all units.
  - Incoming wire size range for the terminal block is no. 4 AWG (American Wire Gage) to 500 kcmil.
  - Incoming wire size range of non-fused disconnect with MCA up to 599.9 amps is 3/0 to 500 kcmil.
  - Incoming wire size range of non-fused disconnect with MCA from 600 to 799.9 amps is 1/0 to 500 kcmil.
  - Incoming wire size range of non-fused disconnect with MCA from 800 to 1199.9 amps is 250 kcmil to 500 kcmil.
  - Data provided circuit 1/circuit 2 where there are two circuits.

### LEGEND

- ICF** — Instantaneous Current Flow  
**MCA** — Minimum Circuit Amps  
**MOCP** — Maximum Overcurrent Protection  
**WD** — Wye-Delta  
**XL** — Across-the-Line

### NOTES:

- Units are suitable for use on electrical systems where voltage supplied to the unit terminals is not below or above the listed minimum and maximum limits. Maximum allowable phase imbalance is: voltage, 2%; amps 10%.
- Cooler heater is wired into the control circuit so it is always operable as long as the control power supply disconnect is on, even if any safety device is open.
- For MCA that is less than or equal to 380 amps, 3 conductors are required.

For MCA between 381-760 amps, 6 conductors are required.  
 For MCA between 761-1140 amps, 9 conductors are required.

For MCA between 1141-1520 amps, 12 conductors are required.

Calculation of conductors required is based on 75 C copper wire.

4. Wiring for main field supply must be rated 75 C minimum. Use copper for all units.

a. Incoming wire size range for the terminal block is no. 4 AWG (American Wire Gage) to 500 kcmil.

b. Incoming wire size range of non-fused disconnect with MCA up to 599.9 amps is 3/0 to 500 kcmil.

c. Incoming wire size range of non-fused disconnect with MCA from 600 to 799.9 amps is 1/0 to 500 kcmil.

#### LEGEND

**ICF** — Instantaneous Current Flow  
**MCA** — Minimum Circuit Amps  
**MOCP** — Maximum Overcurrent Protection  
**WD** — Wye-Delta  
**XL** — Across-the-Line

#### NOTES:

- Units are suitable for use on electrical systems where voltage supplied to the unit terminals is not below or above the listed minimum and maximum limits. Maximum allowable phase imbalance is: voltage, 2%; amps 10%.
- Cooler heater is wired into the control circuit so it is always operable as long as the control power supply disconnect is on, even if any safety device is open.
- For MCA that is less than or equal to 380 amps, 3 conductors are required.

For MCA between 381-760 amps, 6 conductors are required.

For MCA between 761-1140 amps, 9 conductors are required.

For MCA between 1141-1520 amps, 12 conductors are required.

Calculation of conductors required is based on 75 C copper wire.

4. Wiring for main field supply must be rated 75 C minimum. Use copper for all units.

a. Incoming wire size range for the terminal block is no. 4 AWG (American Wire Gage) to 500 kcmil.

b. Incoming wire size range of non-fused disconnect with MCA up to 599.9 amps is 3/0 to 500 kcmil.

c. Incoming wire size range of non-fused disconnect with MCA from 600 to 799.9 amps is 1/0 to 500 kcmil.

d. Incoming wire size range of non-fused disconnect with MCA from 800 to 1199.9 amps is 250 kcmil to 500 kcmil.

5. Data provided circuit 1/circuit 2 where there are two circuits.

#### LEGEND

**ICF** — Instantaneous Current Flow  
**MCA** — Minimum Circuit Amps  
**MOCP** — Maximum Overcurrent Protection  
**WD** — Wye-Delta  
**XL** — Across-the-Line

#### NOTES:

- Units are suitable for use on electrical systems where voltage supplied to the unit terminals is not below or above the listed minimum and maximum limits. Maximum allowable phase imbalance is: voltage, 2%; amps 10%.
- Cooler heater is wired into the control circuit so it is always operable as long as the control power supply disconnect is on, even if any safety device is open.
- For MCA that is less than or equal to 380 amps, 3 conductors are required.

For MCA between 381-760 amps, 6 conductors are required.

For MCA between 761-1140 amps, 9 conductors are required.

For MCA between 1141-1520 amps, 12 conductors are required.

Calculation of conductors required is based on 75 C copper wire.

4. Wiring for main field supply must be rated 75 C minimum. Use copper for all units.

a. Incoming wire size range for the terminal block is no. 4 AWG (American Wire Gage) to 500 kcmil.

b. Incoming wire size range of non-fused disconnect with MCA up to 599.9 amps is 3/0 to 500 kcmil.

c. Incoming wire size range of non-fused disconnect with MCA from 600 to 799.9 amps is 1/0 to 500 kcmil.

d. Incoming wire size range of non-fused disconnect with MCA from 800 to 1199.9 amps is 250 kcmil to 500 kcmil.

5. Data provided circuit 1/circuit 2 where there are two circuits.

\*COMBI box is located at the end of the unit.

†PEB1 and PEB2 boxes are located on the side of the unit. If both boxes are used, the one on the left (viewing from the front of the boxes) is PEB1.

Shaded area means that box is not used on this model.

FLA — Full Load Amps

## Controls

### Microprocessor

The *ComfortLink™* microprocessor controls overall unit operation and controls a number of processes simultaneously. These processes include internal timers, reading inputs, analog to digital conversions, fan control, display control, diagnostic control, output relay control, demand limit, capacity control, head pressure control, and temperature reset. Some processes are updated almost continuously, others every 2 to 3 seconds, and some every 30 seconds. The microprocessor routine is started by switching the Emergency ON-OFF switch to ON position. Pump control of external, single pumps (where configured) will energize the cooler pump to the internal (or CCN) time schedule (or input occupied signal from external system). If chiller control of dual, external pumps is required, the external pump control accessory package (part number 00EFN900003200A) must be installed.

When the unit receives a call for cooling (based on a deviation from chilled water set point), the unit stages up in capacity to maintain the cooler fluid set point. The first compressor starts 1 to 3 minutes after the call for cooling. The *ComfortLink* microprocessor controls the capacity of the chiller by varying the number of compressors on and each loading capacity to satisfy actual dynamic load conditions. The control maintains leaving-fluid temperature set point shown on the *Navigator™* device through intelligent positioning of the slide valve and compressor cycling. Accuracy depends on loop volume, loop flow rate, load, and outdoor-air temperature. No adjustment for cooling range or cooler flow rate is required, because the control automatically compensates for cooling range by measuring both return-fluid temperature and leaving-fluid temperature. This is referred to as leaving-fluid temperature control with return-fluid temperature compensation.

The basic logic for determining when to add or remove capacity is a time band integration of deviation from set point plus rate of change of leaving-fluid temperature.

When leaving-fluid temperature is close to the set point and slowly moving closer, logic prevents additional capacity. If leaving-fluid temperature is less than 34 F (1.1 C) for water, or 6° F (3.3° C) below the brine freeze set point for brine units, the unit is shut off until the water temperature for brine reaches 34 F (1.1 C) or to 6° F (3.3° C) above the set point for brine to protect against freezing.

If pulldown control has been selected (adjustable setting), no additional capacity is added as long as the difference between leaving-fluid temperature and the set point is greater than 4° F (2.2° C) and rate of change in leaving-water temperature is greater than the adjustable setting. If it has been less than 90 seconds since the last capacity change, compressors will continue to run unless a safety device trips. This prevents rapid cycling and also helps return oil during short operating periods.

### Control sequence

**Off cycle** — If ambient temperature is below 36 F (2.2 C), cooler heaters are also energized.

**Start-up** — After control circuit switches on, the prestart process takes place, then microprocessor checks itself, starts pump (if configured) and waits for temperature to stabilize. The controlled pulldown feature limits compressor loading on start-up to reduce demand on start-up and unnecessary compressor usage.

**Capacity control** — On the first call for cooling, the microprocessor starts initial compressor and fan stage on lead circuit.

As additional cooling is required, the capacity of the compressor is increased by changing the position of the slide valve. As the load increases above the compressor's capacity, another compressor is started and both staged together.

The speed at which capacity is added or reduced is controlled by temperature deviation from set point and rate of temperature change of chilled fluid.

# Controls (cont)

The main base board (MBB) responds to the supply chilled water temperature to cycle the compressors to match cooling load requirements.

The minimum load control valve is energized by the MBB. The valve allows hot gas to pass directly into the cooler circuit on the initial step of unloading, permitting the unit to operate at lower loads with less compressor cycling.

## Sensors

Thermistors are used to control temperature-sensing inputs to the microprocessor. No additional thermistor sensors are required for optional leaving chilled water temperature, return water, or outdoor air reset.

The following sensors can be used on 30XA units:

- Cooler leaving chilled fluid temperature (T1)
- Cooler entering fluid (return) temperature (T2)
- Outside-air temperature (T9)
- Space temperature (T10)

Two refrigerant pressure transducers are used in each circuit for sensing suction and discharge pressure. The microprocessor uses these inputs to control capacity and fan cycling.

- Saturated condensing temperature
- Cooler saturation temperature
- Oil
- Economizer

## Additional information

Detailed information on controls and operation is available in the Controls, Start-Up, Operation, Service, and Troubleshooting guide included with each unit. Packaged Service Training programs are also available. Contact a local Carrier representative for more information.

## ComfortLink™ controls

Dynamic ComfortLink controls keep the chiller on line during periods of extreme operating conditions. If the entering fluid temperature is 95 F (35 C) and the saturated suction temperature is 50 F (10 C) or higher the maximum operating pressure (MOP) feature limits the suction to keep the chiller online. The control automatically starts the chiller in the unloaded state to eliminate the potential of compressor overload due to high head pressure or low suction pressure. The controller will equalize run time on each circuit through the lead/lag feature. If a circuit becomes disabled, the control will automatically set the active circuit to lead, keeping the chiller online at a reduced capacity.

**Standard ComfortLink controls with Navigator™ display** — A portable hand-held display for convenient access to unit status, operation, configuration and troubleshooting diagnostics capability is standard on 30XA units. The four-line, 20-character LCD display provides clear language information in English, French, Spanish, or Portuguese. The weatherproof enclosure and industrial grade extension cord enable the Navigator display to be ideally suited for outdoor applications. Magnets located on the back of the module allow attachment to any sheet metal component for hands-free operation.

**Low-temperature override** — This feature prevents LCWT (leaving chilled water temperature) from overshooting the set point and possibly causing a nuisance trip-out by the freeze protection.

**High-temperature override** — This feature allows the chiller to add capacity quickly during rapid load variations.

## Temperature reset

The energy management module is required for 4 to 20 mA reset of LCWT in constant fluid systems. Reset by return fluid, outdoor-air temperature, or space temperature does not require this option. Reset reduces compressor power usage at part load when design LCWT is not necessary. Humidity control should be considered since higher coil temperatures resulting from reset will reduce latent heat capacity. Three reset options are offered, based on the following:

Return-fluid temperature increases LCWT set point as return (or entering) fluid temperature decreases (indicating load decrease). Option may be used in any application where return fluid provides accurate load indication. A limitation of return fluid reset is that LCWT may only be reset to value of design return fluid temperature.

Outdoor-air temperature increases the LCWT as outdoor ambient temperature decreases (indicating load decrease). This reset should be applied only where outdoor ambient temperature is an accurate indication of load.

Space temperature increases the LCWT as space temperature decreases (indicating load decrease). This reset should be applied only where space temperature is an accurate indication of load. An accessory space temperature thermistor is required.

For details on applying a reset option, refer to the Controls, Start-Up, Operation, Service and Troubleshooting literature shipped with the unit. Obtain ordering part numbers for reset option from the Packaged Chiller Builder program or contact a local Carrier representative.

## Safety

**Abnormal conditions** — All control safeties in the chiller operate through compressor protection board or control relay and microprocessor.

Loss of feedback signal to the MBB will cause the compressor(s) to shut down. For other safeties, microprocessor makes appropriate decision to shut down a compressor due to a safety trip or bad sensor reading and displays appropriate failure code on the display. Chiller holds in safety mode until reset; it then reverts to normal control when unit is reset.

**Low-pressure safety** — Safety cuts out if system pressure drops below minimum.

**High-pressure cutout** — Switch shuts down compressors if compressor discharge pressure increases to 305 psig (2102.7 kPa).

**Compressor anti-cycling** — This feature limits compressor cycling.

**Loss of flow protection** — Proof of flow switches are standard and installed on all 30XA chillers.

**Sensor failures** — Failures are detected by the microprocessor.

### Accessory controls

Demand can be limited by controlling the chiller capacity through the demand limit control (the energy management module is required for this function). This F1OP/accessory interfaces with the microprocessor to control the unit so that the chiller's kW demand does not exceed its setting. It is activated from an external switch or a 4 to 20 mA signal.

The standard *ComfortLink™* controller is programmed to accept various accessory temperature reset options (based on outdoor-air temperature [standard], return-fluid temperature [standard], or space temperature [which requires accessory thermistor]), that resets the LCWT. An accessory thermistor (T10) is required if space temperature reset is selected. The Energy Management Module (EMM) is only required for temperature reset that is initiated by a 4 to 20 mA signal.

### Demand limit

If the demand limit is applied, it limits the total power draw of unit to a selected point by controlling the number of operational compressors during periods of peak electrical demand.

The energy management module is required for either 2-step or 4 to 20 mA demand limit.

### Electronic expansion valve (EXV)

The EXV controls refrigerant flow to the cooler for different operating conditions by varying an orifice size to increase or decrease the flow area through the valve based on microprocessor input. The orifice is positioned by a stepper motor through approximately 3,600 discrete steps and is monitored every three seconds.

### Diagnostics

The microprocessor may be put through a service test (see Controls, Start-Up, Operation, Service, and Troubleshooting literature). Service test confirms microprocessor is functional, informs observer through display the condition

of each sensor and switch in chiller, and allows observer to check for proper operation of fans and compressors.

### Default settings

To facilitate quick start-ups, 30XA chillers with *ComfortLink* controls are pre-configured with a default setting that assumes stand-alone operation supplying 44 F (6.6 C) chilled water.

Configuration settings will be based on any options or accessories included with the unit at the time of manufacturing.

Date and time are set to U.S.A. Eastern Time zone and will need reconfiguring based on location and local time zone. If operation based on occupancy scheduling is desired, schedule must be set during installation.

### Ice duty

*ComfortLink* controls have the capability of reduced leaving fluid temperature operation for thermal storage, or ice duty. The optional Energy Management display includes input contacts for the "ice done" signal generated by the thermal storage control system. The ice duty feature may be configured to start on an external input command or by the *ComfortLink* standard internal scheduling function. The ice duty function requires brine modification for leaving fluid temperatures below 40 F (4.4 C). Ice duty may be used in combination with any other standard features offered by the energy management module and *ComfortLink* controls.

The production of ice, which is stored for peak cooling demands, can significantly decrease energy costs. The unit produces ice (normally at night) by supplying ice storage tanks with low temperature cooling fluid. The chiller takes advantage of reduced ambient conditions at night for ice-making mode, so the capacity suffers a lower penalty for the low leaving fluid temperatures.

At peak cooling demands, the chiller and the stored ice may share the cooling load to reduce operating costs. The thermal storage system may potentially reduce the size of the chiller plant required to meet demand loads.

# Control and power wiring schematic

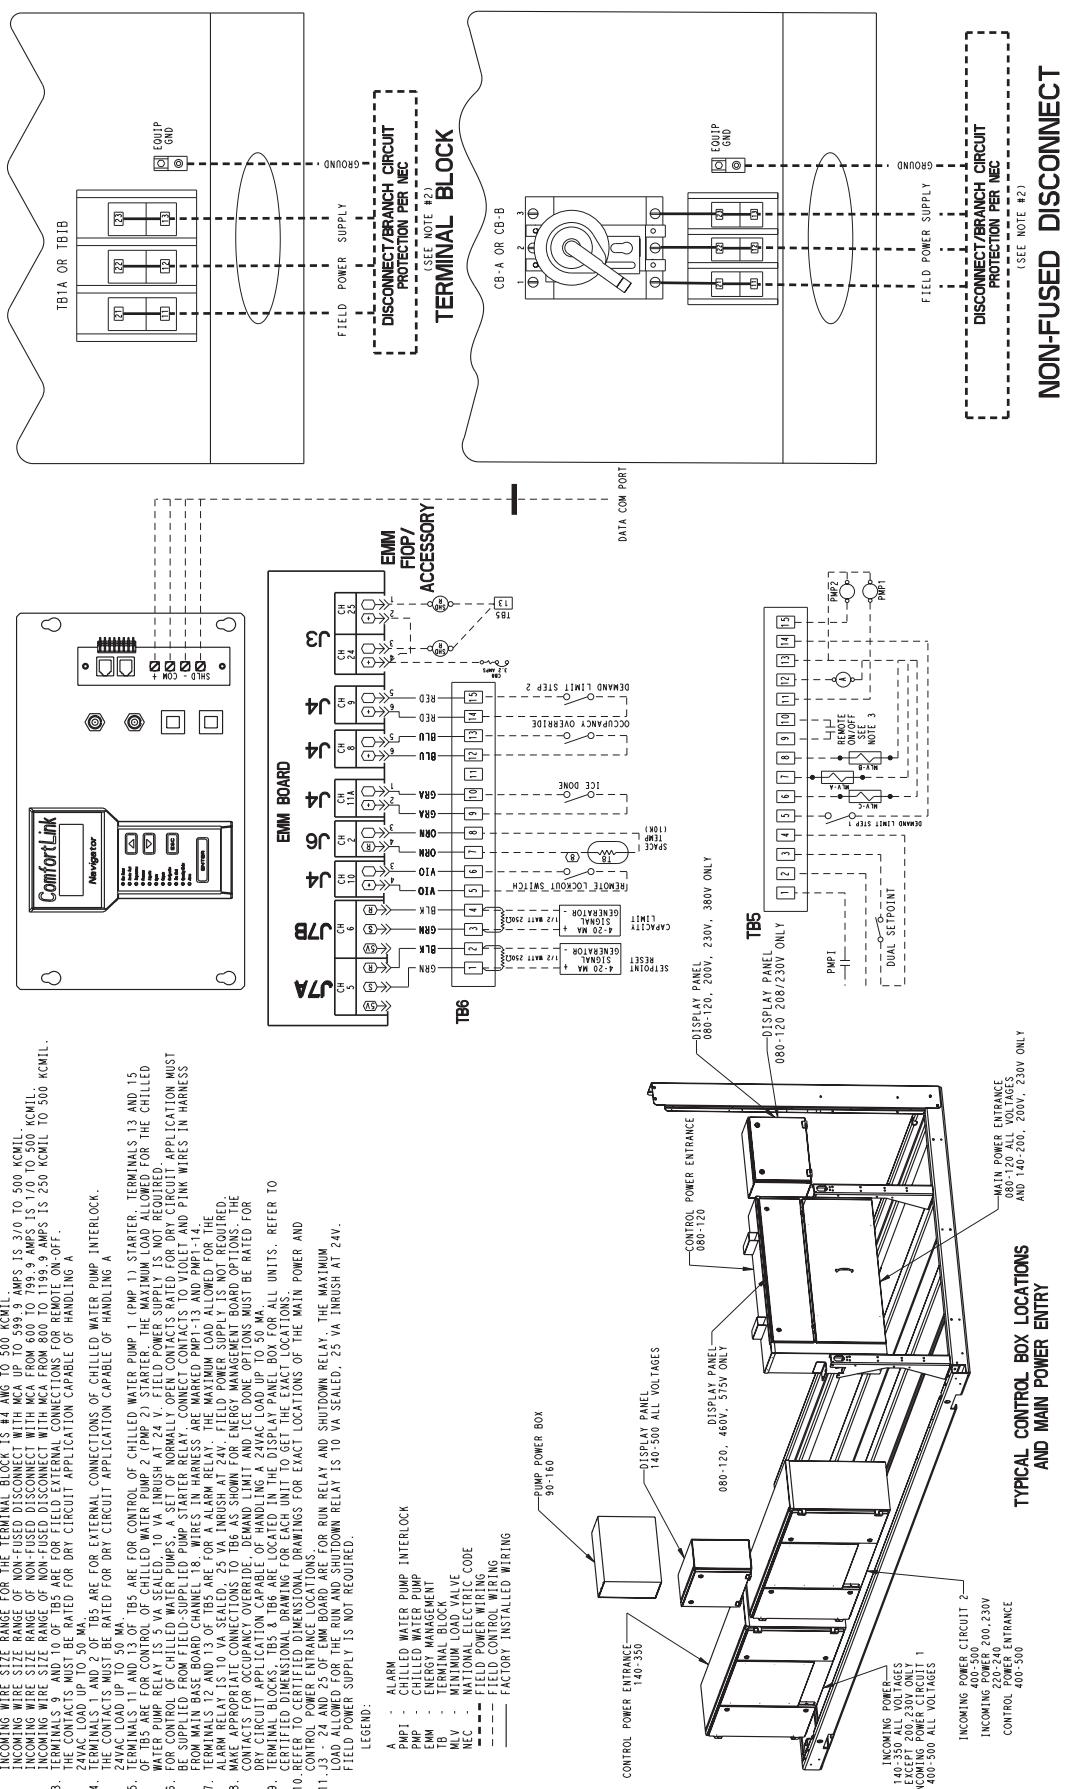

**Carrier**

NOTES:

- FACTORY WIRING IS IN ACCORDANCE WITH UL 1995 STANDARDS. FIELD MODIFICATIONS OR ADDITIONS MUST BE IN COMPLIANCE WITH ALL APPLICABLE CODES.
- WIRING FOR MAIN POWER CIRCUIT MUST BE RATED 75C MINIMUM. USE COPPER FOR ALL UNITS.
- INCOMING WIRE SIZE RANGE FOR THE TERMINAL BLOCK IS #4 AWG TO 500 KCMIL. INCORPORATING WIRE SIZE RANGE OF NON-USED DISCONNECT WITH MAX UP TO 599.9 AMPS IS 3.0 TO 500 KCMIL. INCORPORATING WIRE SIZE RANGE OF NON-USED DISCONNECT WITH MAX 600 TO 119.9 AMPS IS 1.0 TO 500 KCMIL. INCORPORATING WIRE SIZE RANGE OF NON-USED DISCONNECT WITH MAX 120 TO 1000 AMPS IS 1.5 TO 500 KCMIL.
- THE TERMINAL BLOCKS ARE FOR USE ON DRY CIRCUIT APPLICATION CAPABLE OF HANDLING A 24VAC LOAD UP TO 50 VA. MAX LOAD UP TO 50 MA.
- TERMINALS 1 AND 2 OF TB5 ARE FOR EXTERNAL CONNECTIONS OF CHILLED WATER PUMP INTERLOCK. THE CONTACTS MUST BE RATED FOR DRY CIRCUIT APPLICATION CAPABLE OF HANDLING A 24VAC LOAD UP TO 13 MA.
- TERMINALS 11 AND 13 OF TB5 ARE FOR CONTROL OF CHILLED WATER PUMP 1 (PMP 1) STARTER. TERMINALS 13 AND 15 OF TB5 ARE FOR CONTROL OF CHILLED WATER PUMP 2 (PMP 2) STARTER. THE MAXIMUM LOAD ALLOWED FOR THE CHILLED WATER PUMP RELAY IS 5 VA SEALED. 10 VA TURSH AT 24 V. FIELD POWER SUPPLY IS NOT REQUIRED.
- FOR CONTROL OF CHILLED WATER PUMPS, 10 VA TURSH AT 24 V. FIELD POWER SUPPLY IS NOT REQUIRED. FROM MAIN BASE BOARD CHANNEL 10, WIRING IS MARKED TB1113 AND VAMP11A.
- TERMINALS 12 AND 13 OF TB5 ARE FOR OCCUPANCY OVERRIDE CONNECTIONS TO TB6. THE MAXIMUM LOAD ALLOWED FOR THE ALARM RELAY IS 10 VA SEALED. 25 VA TURSH AT 24V FIELD POWER SUPPLY IS NOT REQUIRED.
- MAKE APPROPRIATE CONNECTIONS TO TB6 FOR ENERGY MANAGEMENT BOARD OPTIONS. THE CONTACTS FOR OCCUPANCY OVERRIDE, DEMAND LIMIT, AND ICE LOAD OPTIONS MUST BE RATED FOR DRY CIRCUIT APPLICATION CAPABLE OF HANDLING A 24VAC LOAD UP TO 50 MA.
- TERMINAL BLOCKS TB6 ARE LOCATED IN THE DISPLAY PANEL BOX FOR ALL UNITS. REFER TO CERTIFIED DIMENSIONAL DRAWING FOR EACH UNIT TO GET THE EXACT LOCATIONS.
- REFERS TO CERTIFIED DIMENSIONAL DRAWINGS FOR EXACT LOCATIONS OF THE MAIN POWER AND CONTROL POWER ENTRANCES.
- MAIN 240V AC INPUT FROM TB6 FOR RUN RELAY AND SHUTDOWN RELAY IS 10 VA SEALED. 25 VA TURSH AT 24V FIELD POWER SUPPLY IS NOT REQUIRED.

LEGEND:

- A - ALARM
- PMP - CHILLED WATER PUMP INTERLOCK
- EMM - ENERGY MANAGEMENT
- TB - TERMINAL BLOCK
- MVL - MINIMUM LOAD VALVE
- NEC - NATIONAL ELECTRIC CODE
- - - TIED TO REVERSE POLARITY
- FACTORY INSTALLED WIRING

**TYPICAL CONTROL BOX LOCATIONS AND MAIN POWER ENTRY**

# Application data

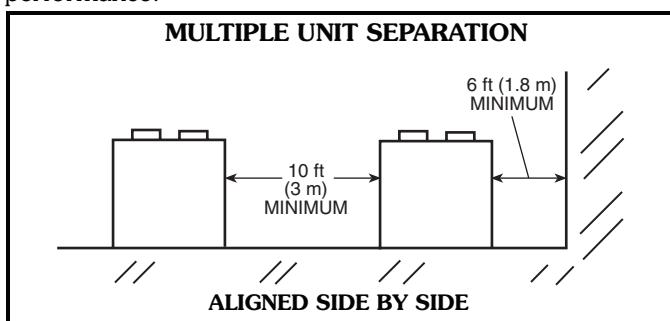

## Chiller location and clearances

Do not locate near sound sensitive areas without proper acoustic consideration. For applications requiring mounting a chiller on a building rooftop, consideration should be given to using rubber-in-shear or spring isolators to minimize structure-borne transmission. Unit must be level when installed to ensure proper oil return to the compressors. Clearances must be provided around chillers for airflow, service and local code requirements. See dimensional drawings for specific unit clearance requirements. Ensure adequate clearance between adjacent chillers is maintained. A minimum of 10 ft (3.0 m) is recommended. Chiller fan discharge must be at least as high as adjacent solid walls. Installation in pits is not recommended.

## Minimum clearances

The recommended minimum clearance to ensure proper airflow through the condenser coils and to allow fan maintenance is as shown below.

Acceptable clearance between the chiller and a single wall may be reduced to 3 ft (914.4 mm) on one side or end opposite the control panel without sacrificing performance. Clearances between chillers in dual chiller applications may be reduced to 6 ft (1.8 m) on one side without sacrificing performance.

## Strainers

A screen strainer with a minimum screen size of 20 mesh must be installed a maximum of 10 ft (3.0 m) from the unit to prevent debris from damaging internal tubes of the cooler.

## Oversizing chillers

Oversizing chillers by more than 15% at design conditions must be avoided as the system operating efficiency is adversely affected (resulting in greater or excessive electrical demand). When future expansion of equipment is anticipated, install a single chiller to meet present load requirements and add a second chiller to meet the additional load demand. It is also recommended that 2 smaller chillers be installed where operation at minimum load is critical. The operation of a smaller chiller loaded to a greater percentage over minimum is preferred to operating a single chiller at or near its minimum recommended value. Minimum load control should not be used as a means to allow oversizing chillers. Minimum load control should be given consideration where substantial operating time is anticipated below the minimum unloading step.

## Cooler water temperature

1. Maximum leaving chilled water temperature (LCWT) for the unit is 60 F (15.5 C). Unit can start and

pull down with up to 95 F (35 C) entering-water temperature. It is recommended that entering-water temperature not exceed 70 F (21.1).

2. Minimum LCWT for a standard unit is 40 F (4.4 C). For leaving-water temperatures below 39.9 F (4.4 C) an inhibited antifreeze solution is required. Application of chiller at leaving fluid temperatures lower than 30 F (-1.1 C) is possible by ordering the factory-installed medium temperature brine option.

NOTE: Water flowing through cooler should not exceed 100 F (37.8 C).

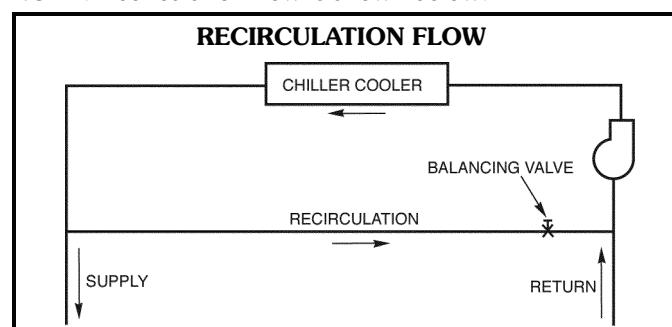

## Cooler flow/range

Ratings and performance data in this publication are for a cooling temperature rise of 10° F (5.6° C). The 30XA chillers may be operated at a different temperature rise, providing flow limits are not exceeded and corrections to system guidelines are made. For minimum and maximum cooler flow rates, see the Minimum and Maximum Cooler Flow Rates table. A high flow rate is generally limited by the maximum pressure drop that can be tolerated by the unit. The 30XA chillers are designed for a full load temperature rise of 5° to 20° F (2.8° to 11.1° C). Use the Carrier Selection Program to obtain the rating if a temperature rise other than 10° F (5.6° C) is used.

**Minimum cooler flow (maximum cooler temperature rise)** — The minimum cooler flow for standard units is shown in the Minimum and Maximum Cooler Flow Rates table. When system design conditions require a lower flow (or higher rise) than the minimum allowable cooler flow, follow the recommendations below.

- a. Multiple smaller chillers may be applied in series, each providing a portion of the design temperature rise.
- b. Cooler fluid may be recirculated to raise the flow rate to the chiller. The mixed temperature entering the cooler must be maintained to a minimum of at least 5° F (2.8° C) above the LCWT and a maximum of no more than 20° F (11.1° C) above the LCWT.

NOTE: Recirculation flow is shown below.

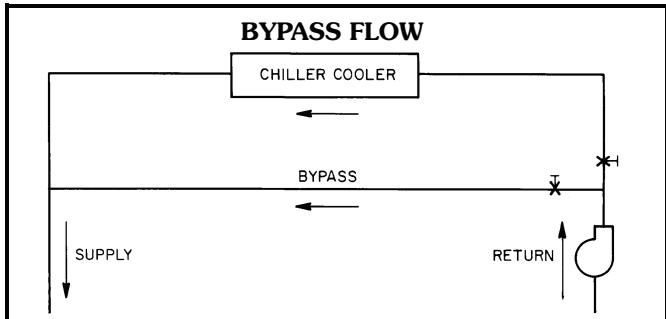

**Maximum cooler flow** — The maximum cooler flow (approximately 5° F [2.8° C] rise) results in a practical maximum pressure drop through cooler.

Return fluid may bypass the cooler to keep the pressure drop through the cooler within acceptable limits. This permits a higher delta T with lower fluid flow through cooler and mixing after the cooler.

# Application data (cont)

NOTE: Bypass flow is shown below.

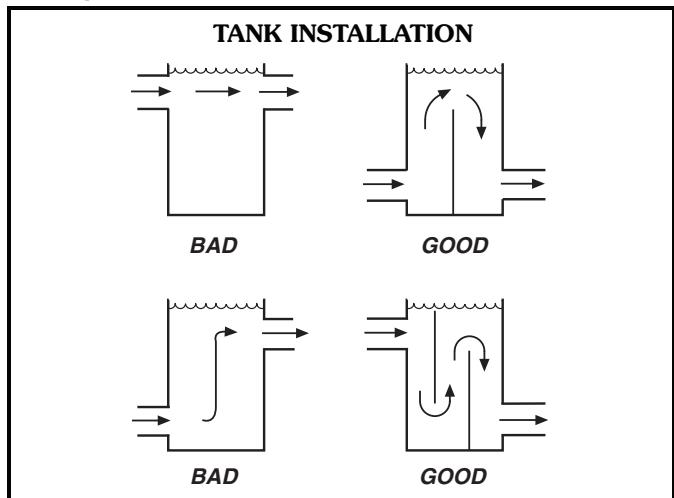

## Variable cooler flow rates

Variable rates may be applied to a standard chiller. The unit will, however, attempt to maintain a constant leaving chilled water temperature. In such cases minimum flow must be in excess of minimum flow given in the Minimum and Maximum Cooler Fluid Flow Rates table, and minimum loop water volume must be in excess of 3 gallons per ton (3.2 l/kW). Flow rate must change in steps of less than 10% per minute. Apply a minimum of 6 gal. per ton (6.5 l/kW) water loop volume if flow rate changes more rapidly.

## Water loop volume

The volume in circulation must equal or exceed 3 gal. per nominal ton (3.2 l/kW) of cooling for temperature stability and accuracy in normal air conditioning applications. In process cooling applications, or for operation at ambient temperature below 32 F (0° C) with low loading conditions, there should be from 6 to 10 gal. per ton (6.5 to 10.8 l/kW). To achieve this volume, it is often necessary to install a tank in the loop.

Tank should be baffled to ensure there is no stratification and that water (or brine) entering tank is adequately mixed with liquid in the tank.

## Cooler fouling factor

The fouling factor used to calculate tabulated ratings is  $0.0001 \text{ ft}^2 \cdot \text{hr} \cdot ^\circ\text{F/Btu}$  ( $.000018 \text{ m}^2 \cdot ^\circ\text{C/W}$ ). As fouling factor is increased, both unit capacity and EER decrease. The impact of the fouling factor on performance varies

significantly with chiller size and application conditions. Ratings must be determined by the Carrier Selection Program.

## Cooler and optional hydronic system freeze protection

Freeze protection for the cooler and the optional hydronic system is standard on all 30XA air-cooled chillers. All units are equipped with cooler heaters. Units are protected from freezing down to 0° F (-18 C) through the cooler heaters and control algorithms. If a unit controls the chilled water pump/valves, allowing for flow through the cooler, the unit is protected from freezing down to -20 F (-29 C). Since power is sometimes lost for extended periods during winter storms, freeze protection provided by heater tapes will be effective only if a back-up power supply can be assured for the unit's control circuit, heater and cooler pump. If not protected with an anti-freeze solution, draining the cooler and outdoor piping is recommended if the system will not be used during freezing weather conditions.

Two conditions that must be considered when determining antifreeze concentration are both leaving water set point and ambient freeze conditions. Both of these parameters can help determine the recommended concentration level. Higher concentration must be used to adequately protect the machine.

NOTE: Use only antifreeze solutions approved for heat exchanger duty.

For applications in which the leaving fluid temperature set point is less than 40 F (4.4 C), a suitable inhibited antifreeze solution must be used. The solution concentration must be sufficient to protect the chilled water loop to a freeze protection (first crystals) concentration of at least 15° F (8.3° C) below the leaving fluid temperature set point.

If the chiller refrigerant or fluid lines are in an area where ambient conditions fall below 34 F (1.1° C), it is highly recommended that an antifreeze solution be added to protect the unit and fluid piping to a temperature of 15° F (8.3° C) below the lowest anticipated ambient temperature.

Select concentration based on either burst or freeze protection as dictated by the application. If the chiller does not operate during the winter, and a start-up is not expected, a burst protection concentration is recommended. This concentration may not be high enough to pump the fluid through the unit. Burst protection is typically a lower concentration that will provide better performance from the machine. If the chiller does operate during winter, a freeze protection concentration is recommended. This concentration will be high enough to keep the fluid in a condition that it can be pumped at low ambient conditions.

**IMPORTANT:** Glycol antifreeze solutions are highly recommended since heater tapes provide no protection in the event of a power failure.

Consult glycol fluid manufacturers for burst protection recommendations and fluid specifications.

## MINIMUM AND MAXIMUM COOLER FLOW RATES

ITEM			MINIMUM		MAXIMUM		NOMINAL	
Cooler Leaving Water Temperature*			40 F (4.4 C)		60 F (15 C)		—	
Cooler Entering Water Temperature†			45 F (7.2 C)		70 F (21.1 C)		—

\*For applications requiring cooler leaving water temperature operation at less than 40 F (4.4 C), the units require the use of antifreeze and application may require the brine option. Contact your local Carrier representative for more information.

†For applications requiring cooler entering water temperature operation at less than 45 F (7.2 C), contact your local Carrier representative for unit selection using the Carrier electronic catalog.

### NOTES:

- The 30XA units will start and pull down with loop temperatures up to 95 F (35 C).
- Nominal flow rates required at ARI conditions 44 F (7 C) leaving fluid temperature, 54 F (12 C) entering water temperature, 95 F (35 C) ambient. Fouling factor 0.00010 ft<sup>2</sup>-hr-F/Btu (0.000018 m<sup>2</sup>-K/kW).
- To obtain proper temperature control, cooler loop fluid volume must be at least 3 gal/ton (3.23 L/kW) of chiller nominal capacity for air conditioning and at least 6 gal/ton (6.5 L/kW) for process applications or systems that must operate in low ambient temperatures (below 32 F [0° C]).

# Application data (cont)

## High ambient temperature operation

High outdoor ambient chiller start-up and operation is possible for standard 30XA chillers at ambient temperatures up to 125 F (52 C) at nominal voltage. For applications approaching these temperatures, it may be advisable to select the high ambient temperature option to increase fan airflow. Further, the high ambient temperature option is required for 30XA400-500 chillers under the following circumstances:

- ambient temperatures at or above 100 F (37.8 C)
- multi-chiller configurations.

## Low ambient temperature operation

Units will start and operate down to 32 F (0° C) as standard. Operation to -20 F (-29 C) requires optional low ambient head pressure control as well as wind baffles (field fabricated and installed to all units for operation below 32 F [0° C]) if wind velocity is anticipated to be greater than 5 mph (8 km/h). Inhibited propylene glycol or other suitable corrosion-resistant antifreeze solution must be field supplied and installed in all units for unit operation below 34 F (1.1 C). Solution must be added to fluid loop to protect loop down to 15° F (8.3° C) below minimum operating ambient temperature. Concentration should be based on expected minimum temperature and either "Burst" or "Freeze" protection levels. At least 6 gal. per ton (6.5 l/kW) of water volume is the recommended minimum for a moderate system load.

## Altitude correction factors

Correction factors must be applied to standard ratings at altitudes above 2000 ft (609.6 m) using the following multipliers:

### ALTITUDE CORRECTION FACTORS

ALTITUDE (ft)	ALTITUDE (m)	CAPACITY MULTIPLIER	COMPRESSOR POWER MULTIPLIER
2,000	609.6	0.99	1.01
4,000	1219.2	0.98	1.02
6,000	1828.8	0.97	1.03
8,000	2438.4	0.96	1.04
10,000	3048	0.95	1.05

**Condenser airflow** — Airflow restrictions on units with standard fans will affect the unit capacity, condenser head pressure, and compressor power input. Correction factors to be applied for external static restrictions up to 0.2 in. wg (50 Pa) are as follows:

EXTERNAL STATIC in. wg	EXTERNAL STATIC Pa	CAPACITY MULTIPLIER	COMPRESSOR POWER MULTIPLIER
0.0	0.0	1.000	1.00
0.1	25	0.986	1.01
0.2	50	0.968	1.03

## Multiple chillers

Where multiple chillers are required, or where standby capability is desired, chillers may be installed in parallel. Units may be of the same size or different sizes. However, cooler flow rates must be balanced according to the recommendations for each chiller to ensure proper flow.

Unit software is capable of controlling two units as a single plant. Refer to the Controls, Start-Up, Operation, Service, and Troubleshooting guide for further details.

## Dual chiller control

The ComfortLink™ controller allows 2 chillers (piped in parallel or series) to operate as a single chilled water plant with standard control functions coordinated through the master chiller controller. This standard ComfortLink feature requires a communication link between the 2 chillers.

There are several advantages to this type of control:

- Redundancy (multiple circuits)
- Better low load control (lower tonnage capability)
- Lower rigging lift weights (2 machines rather than 1 large machine)
- Chiller lead-lag operation (evens the wear between the two machines)

**Parallel dual chiller operation** — Parallel chiller operation is the recommended option for dual chiller control. In this case, each chiller must control its own dedicated pump or isolation valve. Balancing valves are recommended to ensure proper flow in each chiller. Two field-supplied and installed leaving water temperature sensors are required, one for each module, for this function to operate properly. The hardware required to accomplish this dual-chiller coordination is available as a field-installed accessory.

Consider adding additional isolation valves to isolate each chiller to allow for service on a machine, and still allow for partial capacity from the other chiller.

**Series dual chiller operation** — Series chiller operation is an alternate control method supported by the ComfortLink control system. Certain applications might require that the two chillers be connected in series. For nominal 10° F (5.6° C) cooler ranges, use the Minus 1 Pass Cooler arrangement to reduce the fluid-side pressure drop. Use the standard cooler pass arrangement for low flow, high cooler temperature rise applications. Two field-supplied and installed dual chiller leaving water temperature sensors are required, one for each module, for this function to operate properly.

Consider adding additional piping and isolation valves to isolate each chiller to allow for service on a machine, and still allow for partial capacity from the other chiller.

## Condenser coil protection (*Enviro-Shield™*)

Refer to the environmental selection guides for more information. If the standard Novation® (microchannel) coil does not meet the corrosion requirements for a given application, additional coil options are available. For specific geographical recommendations, please refer to the NACO Packaged Chiller Builder program.

**Aluminum fin/copper tube coils** are constructed of seamless copper tubes mechanically bonded to aluminum fins. The fins have wavy enhancements. These condenser coils are recommended with remote cooler applications. These coils are not recommended for corrosive environments.

**Pre-coated aluminum-fin coils** have a durable epoxyphenolic coating applied to the fin prior to the fin stamping process to provide protection in mildly corrosive coastal environments. Pre-coated coils have an inert barrier between the aluminum fin and copper tube. This barrier electrically disconnects the dissimilar metals to minimize the potential for galvanic corrosion. This

economical option provides substantial corrosion protection beyond the standard uncoated coil construction.

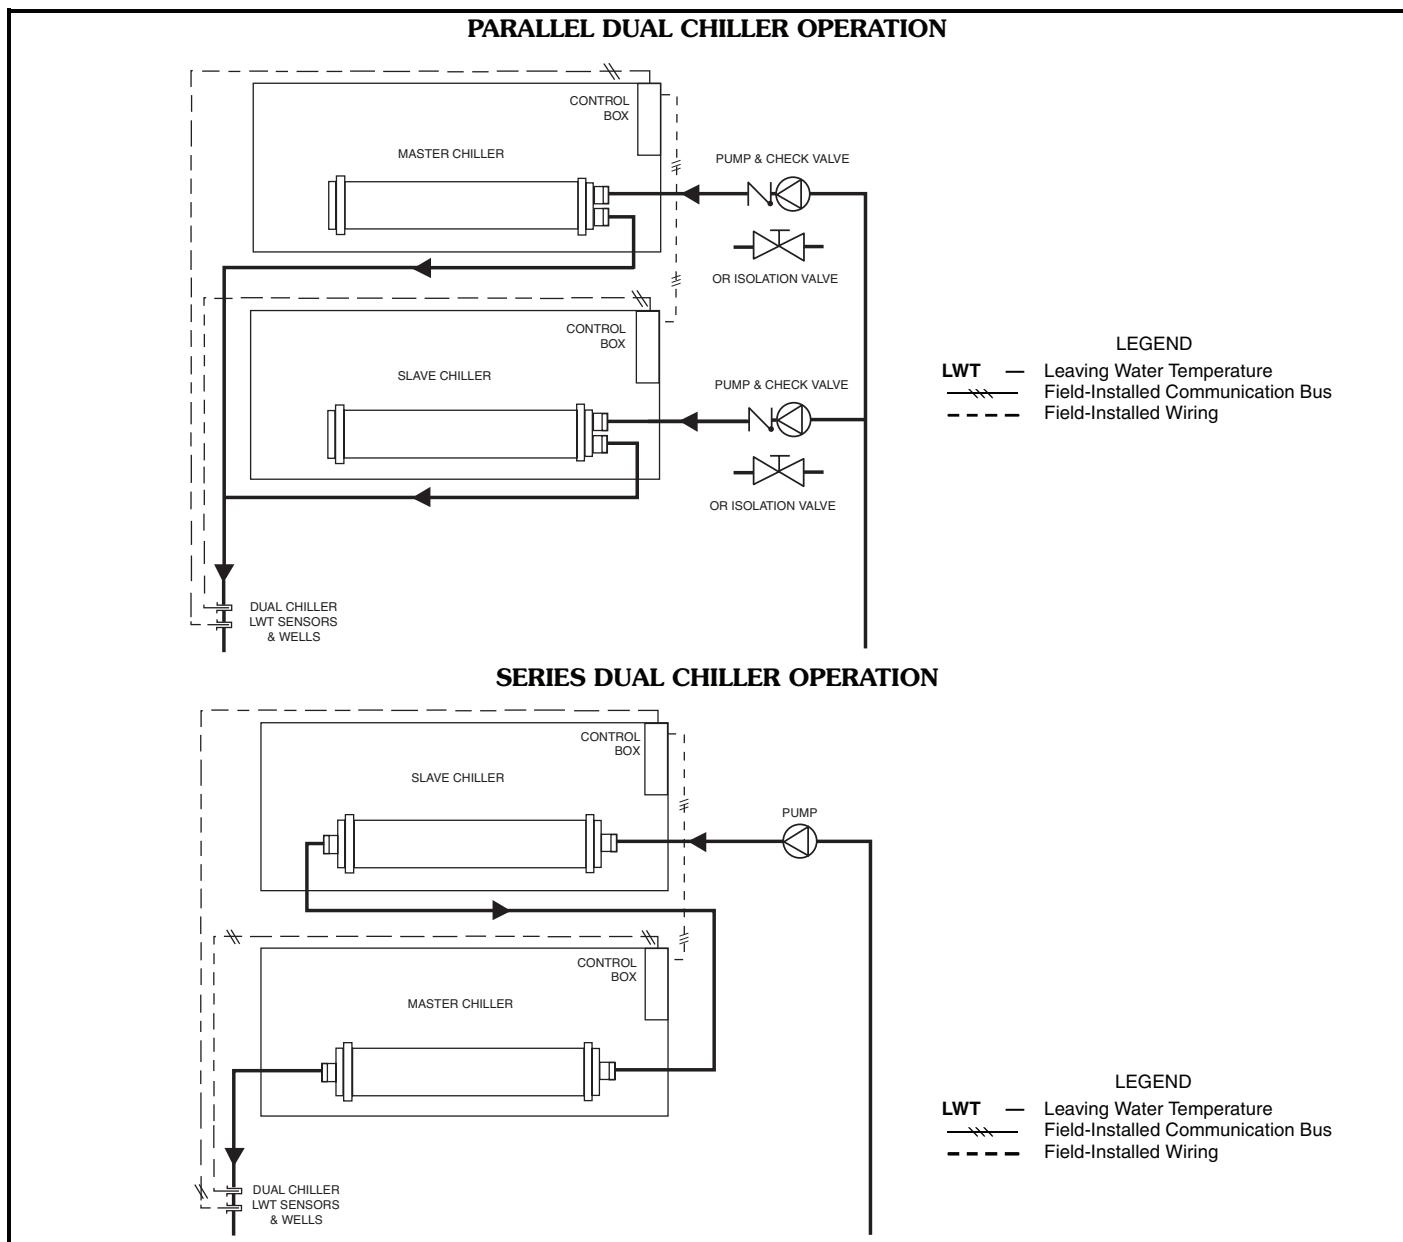

**Copper-fin coils** provide increased corrosion resistance compared to aluminum fin coils. All-copper coils eliminate bimetallic construction to eliminate the potential for galvanic corrosion. Application in industrial environments is not recommended due to potential attack from sulfur, sulfur oxide, nitrogen oxides, carbon and several other industrial airborne contaminants.

**E-coated Novation® coils** have an extremely flexible and durable epoxy coating uniformly applied to all coil surfaces. Unlike brittle phenolic dip and bake coatings, e-coat provides superior protection with unmatched flexibility, edge coverage, metal adhesion, thermal performance and most importantly, corrosion resistance. E-coated coils

provide this protection since all coil surfaces are completely encapsulated from environmental contamination. This option provides the best protection for Novation coil technology.

**E-coated aluminum-fin coils** have the same flexible and durable epoxy coating as e-coated Novation coils. This option provides better protection compared to standard or precoated aluminum-fin coils in many environments.

**E-coated copper-fin coils** have the same flexible and durable epoxy coating as other e-coated coils. However, this option combines the natural salt and environmental resistance of all-copper construction with the highest level of corrosion protection within the round-tube, plate-fin type of coils.

# Application data (cont)

## Optional hydronic system selection

Select pump flow from resulting chiller selection and total pressure loss in the system plus the chiller internal pressure loss.

NOTE: Maximum flow (gpm [L/s]), pressure and pump hp must not exceed maximum indicated on pump curve.

Pump flow can be reduced by using the factory-supplied combination valve up to 10%. Beyond that, impeller trimming is recommended to reduce energy consumption. Follow local codes or ASHRAE 90.1 recommendations. Contact your Carrier representative for the specific amount of trim required.

The AquaForce® 30XA chiller will require a field-supplied expansion tank when the optional pump package is provided.

The expansion tank is based on fluid type, temperature range, fluid pressure and loop volume.

Parallel chillers with hydronic packages require that pump inlets be equalized to prevent pump cavitation. If more than one expansion tank is to be used in the chiller water loop, the expansion tanks must be located together in the common pump suction header. If expansion tank relocation is required for parallel chiller configuration, all materials needed for expansion tank relocation are field supplied. Appropriate measures must be taken for freeze protection.

NOTE: It is recommended for units with the hydronic package that an inlet isolation (shutoff) valve be placed exterior to the unit to allow removal and service of the entire pump assembly, if necessary. The hydronic package is supplied from the factory with a combination valve for isolation of leaving water. Also, if the unit is isolated with valves, a properly sized pressure relief valve is recommended and should be installed in the piping between the unit and the valves, following all applicable local codes.

## Air separation

For proper system operation, it is essential that water loops be installed with proper means to manage air in the system. Free air in the system can cause noise, reduce terminal output, stop flow, or even cause pump failure due to pump cavitation. For closed systems, equipment should be provided to eliminate all air from the system.

The amount of air that water can hold in solution depends on the pressure and temperature of the water/air mixture. Air is less soluble at higher temperatures and at lower pressures. Therefore, separation can best be done at the point of highest water temperature and lowest pressure. Typically, this point would be on the suction side of the pump as the water is returning from the system or terminals. This is generally the optimal place to install an air separator, if possible.

Install automatic air vents at all high points in the system. (If the 30XA unit is located at the high point of the system, a vent can be installed on the piping leaving the heat exchanger on the 1/4 in. NPT female port.)

Install an air separator in the water loop, at the place where the water is at higher temperatures and lower pressures — usually in the chilled water return piping. On a primary-secondary system, the highest temperature water is normally in the secondary loop, close to the decoupler. Preference should be given to that point on the system. In-line or centrifugal air separators are readily available in the field.

It may not be possible to install air separators at the place of the highest temperature and lowest pressure. In such cases, preference should be given to the points of highest temperature. It is important that the pipe be sized correctly so that free air can be moved to the point of separation. Generally, a water velocity of at least 2 feet per second (0.6 m per second) will keep free air entrained and prevent it from forming air pockets.

Automatic vents should be installed at all physically elevated points in the system so that air can be eliminated during system operation. Provisions should also be made for manual venting during the water loop fill.

**IMPORTANT:** Automatic vents should be located in accessible locations for maintenance purposes and protected from freezing.

## Electrical/utility interests

**Energy management** — Use of energy management practices can significantly reduce operating costs, especially during off-peak modes of operation. Demand limiting and temperature reset are two techniques for accomplishing efficient energy management. See Demand Limiting (also called load shedding) section below for further details.

## Demand limiting (load shedding)

When a utility's demand for electricity exceeds a certain level, loads are shed to keep electricity demand below a prescribed maximum level. Typically, this happens on hot days when air conditioning is most needed. The energy management module (EMM) can be added to accomplish this reduction. Demand may be limited on the unit by resetting water temperature, or by unloading the chiller to a given predetermined percentage of the load. Demand limit may also be driven by an external 4 to 20 mA signal. These features require a signal from an intelligent central control. Do not cycle demand limiter for less than 10 minutes on and 5 minutes off. Duty cycling cycles electrical loads at regular intervals regardless of need. This reduces the electrical operating costs of building by "fooling" demand indicating devices. Duty cycling of compressors or fans is not recommended since motor winding and bearing life will suffer from constant cycling.

## Remote on-off control

Remote on-off control may be applied by hard-wired connection (see Controls and Troubleshooting literature) or by connection to the Carrier Comfort Network® (CCN) system.

### **Minimum time to power chiller before start-up**

In order to ensure that the oil sump heaters are provided sufficient time to raise the oil sump temperature to the required operating point, power must be applied to the control circuit a minimum or 24 hours prior to chiller

start-up. On 30XA chillers, the control circuit obtains its power either from a direct 115-V, single-phase power source or from an optional control transformer on the main 3-phase power supply. The control circuit power source must be energized at least 24 hours prior to chiller start-up.

# Guide specifications

## Air-Cooled Liquid Chiller

### HVAC Guide Specifications

Size Range: **80 to 500 Tons, Nominal  
(265 to 1615 kW, Nominal)**

Carrier Model Number: **30XA**

#### Part 1 — General

##### 1.01 SYSTEM DESCRIPTION

Microprocessor controlled, air-cooled liquid chiller utilizing screw compressors and low sound fans.

##### 1.02 QUALITY ASSURANCE

- A. Unit shall be rated in accordance with ARI Standard 550/590 (U.S.A.) latest edition and all units shall be ASHRAE 90.1 compliant.
- B. Unit construction shall comply with ASHRAE 15 Safety Code, UL 1995, and ASME applicable codes (U.S.A. codes).
- C. Unit shall be manufactured in a facility registered to ISO 9001:2000 Manufacturing Quality Standard.
- D. Unit shall be full load run tested at the factory.

##### 1.03 DELIVERY, STORAGE AND HANDLING

- A. Unit controls shall be capable of withstanding 150 F (65.5 C) storage temperatures in the control compartment.
- B. Unit shall be stored and handled per unit manufacturer's recommendations.

#### Part 2 — Products

##### 2.01 EQUIPMENT

###### A. General:

Factory assembled, single-piece chassis, air-cooled liquid chiller. Contained within the unit cabinet shall be all factory wiring, piping, controls, refrigerant charge (R-134a), and special features required prior to field start-up.

###### B. Unit Cabinet:

1. Frame shall be of heavy-gage, painted galvanized steel.
2. Cabinet shall be galvanized steel casing with a baked enamel powder or pre-painted finish.
3. Cabinet shall be capable of withstanding 500-hour salt spray test in accordance with the ASTM (U.S.A.) B-117 standard.

###### C. Fans:

1. Condenser fans shall be direct-driven, 9-blade airfoil cross-section, reinforced polymer construction, shrouded-axial type, and shall be statically and dynamically balanced with inherent corrosion resistance.
2. Air shall be discharged vertically upward.
3. Fans shall be protected by coated steel wire safety guards.

###### D. Compressor/Compressor Assembly:

1. Comprised of semi-hermetic twin screw type compressors.

2. Compressor motor shall be direct drive, 3500 rpm, protected by motor temperature sensors, suction gas cooled motor.

3. Capacity control shall utilize an infinitely modulating slide valve to modulate capacity from 100% to 15% full load.

###### E. Cooler:

1. Shall be a mechanically cleanable tubes in a shell-and-tube type cooler with removable heads.
2. Tubes shall be internally enhanced seamless-copper type rolled into tube sheets.
3. Shall be equipped with Victaulic-type water connections.
4. Shell and cooler heads shall be insulated with 3/4-in. PVC foam (closed-cell) with a maximum K factor of 0.28.
5. Design shall incorporate a minimum of 2 or 3 independent refrigerant circuits.
6. Cooler shall be tested and stamped in accordance with ASME Code for a refrigerant working side pressure of 220 psig. Cooler shall have a maximum water-side pressure of 300 psig.
7. Cooler shall have a cooler drain and vent.
8. Low-ambient temperature protection: unit shall have factory-installed cooler heater, and pumpout cycle to protect cooler from ambient temperature freeze down to 0° F (-17.8 C).
9. Cooler shall be provided with a factory-installed flow switch.

###### F. Condenser:

1. Coil shall be air-cooled Novation® heat exchanger technology (MCHX) and shall have a series of flat tubes containing a series of multiple, parallel flow microchannels layered between the refrigerant manifolds. Novation coils shall consist of a two-pass arrangement. Coil construction shall consist of aluminum alloys for fins, tubes, and manifolds in combination with a corrosion-resistant coating.
2. Tubes shall be cleaned, dehydrated, and sealed.
3. Assembled condenser coils shall be leak tested and pressure tested at 375 psig (2585 kPa).

###### G. Refrigeration Components:

Refrigerant circuit components shall include replaceable-core filter drier, moisture indicating sight glass, electronic expansion valve, discharge service valves and liquid line service valves, and complete operating charge of both refrigerant R-134a and compressor oil.

###### H. Controls, Safeties, and Diagnostics:

1. Unit controls shall include the following minimum components:
  - a. Microprocessor with non-volatile memory. Battery backup system shall not be accepted.

- b. Separate terminal block for power and controls.
  - c. Separate 115-v power supply to serve all controllers, relays, and control components.
  - d. ON/OFF control switch.
  - e. Replaceable solid-state controllers.
  - f. Pressure sensors installed to measure suction, oil, economizer, and discharge pressure. Thermistors installed to measure cooler entering and leaving fluid temperatures and outside air temperature.
2. Unit controls shall include the following functions:
- a. Automatic circuit lead/lag.
  - b. Capacity control based on leaving chilled fluid temperature and compensated by rate of change of return-fluid temperature with temperature set point accuracy to 0.1° F (0.05° C).
  - c. Limiting the chilled fluid temperature pull-down rate at start-up to an adjustable range of 0.2° F to 2° F (0.1 to 1.1° C) per minute to prevent excessive demand spikes at start-up.
  - d. Seven-day time schedule.
  - e. Leaving chilled fluid temperature reset from return fluid and outside air temperature.
  - f. Chilled water pump start/stop control.
  - g. Chiller control for parallel chiller applications without addition of hardware modules and control panels (requires thermistors).
  - h. Timed maintenance scheduling to signal maintenance activities for strainer maintenance and user-defined maintenance activities.
  - i. Low ambient protection to energize cooler heaters.
  - j. Single step demand limit control activated by remote contact closure.
3. Diagnostics:
- a. The control panel shall include, as standard, a display:
    - 1) Touch screen display consisting of 1/4 VGA LCD (liquid crystal display) with adjustable contrast and backlighting.
    - 2) Display shall allow a user to navigate through menus, select desired options and modify data.
  - b. Features of the display shall include:
    - 1) Display shall be customizable and allow up to 72 data points.
    - 2) Display shall support both local equipment or network made for remote mount.
    - 3) Display shall allow access to configuration, maintenance, service, set point, time schedules, alarm history and status data.
- 4) Display shall have one button for chiller on/off.
- 5) Display shall include three levels of password protection against unauthorized access to configuration and maintenance information, and display set up parameters.
- 6) Display shall allow for easy connection of a portable hand held technician tool to access information and upload and/or download chiller settings.
- 7) Display shall be compatible with the Carrier Comfort Network® (CCN) system and provide network alarm acknowledgement or indication and provide capability to fully monitor and control chiller.
- 8) Display alarms and parameters shall be capable of being displayed in full text.
- 9) Display shall be capable of displaying the last 50 alarms and will store a snapshot of a minimum of 20 status data parameters for each alarm.
- 10) Compressor run hours.
- 11) Compressor number of starts.
- 12) Compressor current.
- 13) Time of day:
  - a) Display module, in conjunction with the microprocessor, must also be capable of displaying the output (results) of a service test. Service test shall verify operation of every switch, thermistor, fan, and compressor before chiller is started.
  - b) Diagnostics shall include the ability to review a list of the 30 most recent alarms with clear language descriptions of the alarm event. Display of alarm codes without the ability for clear language descriptions shall be prohibited.
  - c) An alarm history buffer shall allow the user to store no less than 30 alarm events with clear language descriptions, time and date stamp event entry.
  - d) The chiller controller shall include multiple connection ports for communicating with the local equipment network, the Carrier Comfort Network (CCN) system and the ability to access all chiller control functions from any point on the chiller.
  - e) The control system shall allow software upgrade without the need for new hardware modules.
4. Safeties:
- a. Unit shall be equipped with thermistors and all necessary components in conjunction

# Guide specifications (cont)

with the control system to provide the unit with the following protections:

- 1) Loss of refrigerant charge.
- 2) Reverse rotation.
- 3) Low chilled fluid temperature.
- 4) Motor overtemperature.
- 5) High pressure.
- 6) Electrical overload.
- 7) Loss of phase.
- 8) Loss of chilled water flow.

b. Condenser-fan motors shall have internal overcurrent protection.

## I. Operating Characteristics:

1. Unit shall be capable of starting and running at outdoor ambient temperatures from 32 F (0° C) to 125 F (52 C) for all sizes.
2. Unit shall be capable of starting up with 95 F (35 C) entering fluid temperature to the cooler.

## J. Motors:

Condenser-fan motors shall be totally enclosed, air over, single speed, 3-phase type with permanently lubricated bearings and Class F insulation.

## K. Electrical Requirements:

1. Unit primary electrical power supply shall enter the unit at a single location (all chiller voltage/size combinations shall have the ability to accommodate 2 power supplies to meet job-specific requirements).
2. Primary electrical power supply shall be rated to operate up to 125 F (52 C) ambient temperature.
3. Unit shall operate on 3-phase power at the voltage shown in the equipment schedule.
4. Control points shall be accessed through terminal block.
5. Unit shall be shipped with factory control and power wiring installed.

## L. Chilled Water Circuit:

1. Chilled water circuit shall be rated for 300 psig (2068 kPa). Units with optional pump package are rated for 150 psig (1034 kPa) working pressure.
2. Thermal dispersion proof of flow switch shall be factory installed and wired.
3. Optional hydronic package (sizes 090-160):
  - a. Field pipe connections shall be Victaulic type.
  - b. Optional single or primary/stand-by operation pump systems. Dual pump systems shall have a pump discharge check valve.
  - c. Pumps shall be single stage design, for installation in vertical position and capable of being serviced without disturbing piping connections.
    - 1) Pump casing shall be of class 30 cast iron.

- 2) The impeller shall be of cast bronze, closed type, dynamically balanced, keyed to the shaft and secured by locking cap screw.
- 3) The hydronic kit will be provided with a flush line connection to ensure lubrication at the seal face and allow for positive venting of the seal chamber.
- 4) Each port shall be fitted with an isolation valve that allow the units to operate in parallel or standby, yet may be used to isolate one pumping unit for servicing or removal with the other pump still running.
- 5) Pump shall be rated for 150 psig (1034 kPa) working pressure.
- 6) The pump case shall have gage tappings at the suction and discharge nozzles and include drain ports.
- 7) Dual pumps shall allow for the servicing of one pump without draining the chilled water loop.
- 8) Motors shall totally enclosed 3-phase type with grease lubricated ball bearings.
- 9) Each pump shall be factory tested per Hydraulic Institute Standards.

- d. Pressure/temperature taps (3) shall be factory installed to measure the pressure differential across the pump and across the strainer.
- e. Combination valve shall be factory installed. Pressure/temperature taps (2) shall be factory installed to measure the pressure differential across the combination valve.
- f. Hydronic assembly shall have factory supplied electric freeze protection to -20 F (-29 C).
- g. Piping shall be Schedule 40 black steel.
- h. Cast iron or ductile iron body strainer with 8 mesh screen. A factory-installed, removable fine mesh clean-out strainer for initial run period shall be included.

## M. Special Features:

Certain standard features are not applicable when the features designated by \* are specified. For assistance in amending the specifications, contact your Carrier representative.

### \* 1. Low Ambient Temperature Head Pressure Control:

Unit shall be capable of running at outdoor ambient temperatures down to -20 F (-29 C) with the addition of antifreeze in the cooler circuit, wind baffles, and field-installed or factory-installed solid-state low ambient temperature head pressure control with condenser coil temperature sensor.

2. Unit-Mounted Non-Fused Disconnect:  
Unit shall be supplied with factory-installed, lockable, non-fused electrical disconnect for main power supply.
3. Optional Condenser Coil Materials:
  - a. E-coated microchannel coils:  
E-coated aluminum microchannel coil shall have a flexible epoxy polymer coating uniformly applied to all coil external surface areas without material bridging between fins or louvers. Coating process shall ensure complete coil encapsulation, including all exposed fin edges. E-coat shall have a thickness of 0.8 to 1.2 mil with top coat having a uniform dry film thickness from 1.0 to 2.0 mil on all external coil surface areas including fin edges. E-coated coils shall have superior hardness characteristics of 2H per ASTM D3363-00 and cross hatch adhesion of 4B-5B per ASTM D3359-02. Impact resistance shall be up to 160 in./lb (ASTM D2794-93). E-coated coil shall have superior impact resistance with no cracking, chipping, or peeling per NSF/ANSI 51-2002 Method 10.2.
  - b. Aluminum fin/copper-tube coils:  
Coil shall be constructed of seamless copper tubes mechanically bonded to aluminum fins. fins shall have wavy enhancements. These condenser coils are recommended with remote cooler applications. These coils are not recommended for corrosive environments.
  - c. Pre-coated aluminum-fin coils:  
Shall have a durable epoxy-phenolic coating to provide protection in mildly corrosive coastal environments. Coating shall be applied to the aluminum fin stock prior to the fin stamping process to create an inert barrier between the aluminum fin and copper tube. Epoxy-phenolic barrier shall minimize galvanic action between dissimilar metals.
  - d. Copper-fin coils:  
Shall be constructed of copper fins mechanically bonded to copper tubes and copper tube sheets. Galvanized steel tube sheets shall not be acceptable. A polymer strip shall prevent coil assembly from contacting sheet metal coil pan to minimize potential for galvanic corrosion between the coil and pan. All copper construction shall provide protection in moderate coastal applications.
  - e. E-coated aluminum-fin coils:  
Shall have a flexible epoxy polymer coating uniformly applied to all coil surface areas without material bridging between fins. Coating process shall ensure complete coil encapsulation. Color shall be high gloss

black with gloss — 60° of 65-90% per ASTM D523-89. Uniform dry film thickness from 0.8 to 1.2 mil on all surface areas including fin edges. Superior hardness characteristics of 2H per ASTM D3363-92A and cross hatch adhesion of 4B-5B per ASTM D3359-93. Impact resistance shall be up to 160 in./lb (ASTM D2794-93). Humidity and water immersion resistance shall be up to minimum 1000 and 250 hours respectively (ASTM D2247-92 and ASTM D870-92). Corrosion durability shall be confirmed through testing to no less than 3000 hours salt spray per ASTM B117-90. Coil construction shall be aluminum fins mechanically bonded to copper tubes.

- f. E-coated copper-fin coils:  
Shall have a flexible epoxy polymer coating uniformly applied to all coil surface areas without material bridging between fins. Coating process shall ensure complete coil encapsulation. Color shall be high gloss black with gloss — 60° of 65-90% per ASTM D523-89. Uniform dry film thickness from 0.8 to 1.2 mil on all surface areas including fin edges. Superior hardness characteristics of 2H per ASTM D3363-92A and cross hatch adhesion of 4B-5B per ASTM D3359-93. Impact resistance shall be up to 160 in./lb (ASTM D2794-93). Humidity and water immersion resistance shall be up to minimum 1000 and 250 hours respectively (ASTM D2247-92 and ASTM D870-92). Corrosion durability shall be confirmed through testing to no less than 3000 hours salt spray per ASTM B117-90. Coil construction shall be copper-fins mechanically bonded to copper tube sheets. Galvanized steel tube sheets shall not be acceptable. A polymer strip shall prevent coil assembly from contacting sheet metal coil pan to maintain coating integrity and minimize corrosion potential between the coil and pan.

4. Remote Enhanced Display:  
Unit shall be supplied with indoor-mounted, remote, 40-character per line, 16-line display panel for field installation.
5. Medium Temperature Brine (080-350 only):  
Unit shall be factory modified to start and operate at leaving chilled fluid temperatures below 30 F (-1.1 C).
6. Energy Management Module:  
A factory or field-installed module shall provide the following energy management capabilities: 4 to 20 mA signals for leaving fluid temperature reset, cooling set point reset or demand limit control; 2-step demand limit control (from 0% to 100%) activated by a remote contact closure;

# Guide specifications (cont)

- and discrete input for "Ice Done" indication for ice storage system interface.
7. Condenser Coil Trim Panels:  
Unit shall be supplied with field-installed coil covers.
8. BACnet™ Translator Control:  
Unit shall be supplied with field-installed interface between the chiller and a BACnet Local Area Network (LAN, i.e., MS/TP EIA-485).
9. LON Translator Control:  
Unit shall be supplied with field-installed interface between the chiller and a Local Operating Network (LON, i.e., LonWorks FT-10A ANSI/EIA-709.1).
10. Navigator™ hand held portable display:  
a. Portable hand held display module with a minimum of 4 lines and 20 characters per line, or clear English, Spanish, Portuguese or French language.  
b. Display menus shall provide clear language descriptions of all menu items, operating modes, configuration points and alarm diagnostics. Reference to factory codes shall not be accepted.  
c. RJ-14 connection plug shall allow display module to be connected to factory-installed receptacle.  
d. Industrial grade coiled extension cord shall allow the display module to be moved around the chiller.  
e. Magnets shall hold the display module to any sheet metal panel to allow hands-free operation.  
f. Display module shall have NEMA 4x housing suitable for use in outdoor environments.  
g. Display shall have back light and contrast adjustment for easy viewing in bright sunlight or night conditions.  
h. Raised surface buttons with positive tactile response.
11. Touch Pilot™ display:  
Unit shall be supplied with a remote mount touch screen display for network attachment to the chiller.
12. Compressor Suction Service Valve:  
Standard refrigerant discharge isolation and liquid valves enable service personnel to store the refrigerant charge in the cooler or condenser during servicing. This factory-installed option allows for further isolation of the compressor from the cooler vessel.
13. Suction Line Insulation:  
Insulation is tubular closed-cell insulation. This option is required with the medium temperature brine option and recommended for areas of high dewpoints where condensation may be a concern.
14. Service Option:  
The service option provides a remote service port for Navigator™ connection and a factory-installed convenience outlet that includes 4-amp GFI (Ground Fault Interrupt) receptacle with independent fuse protection. Convenience outlet is 115-v female receptacle. Service option not available with 380 v.
15. Remote Service Port:  
Shall be a field-installed receptacle for Navigator device connection.
16. Wye-Delta Starter:  
Unit shall have a factory-installed, wye-delta start to minimize electrical inrush current.
17. Control Transformer:  
Unit shall be supplied with a factory-installed transformer that will allow supply control circuit power from the main unit power supply.
18. GFI Convenience Outlet:  
Shall be factory or field-installed and mounted with easily accessible 115-v female receptacle. Shall include 4 amp GFI receptacle.
19. Plus-One-Pass Cooler:  
Unit shall be equipped with plus-one-pass cooler heads to be used with low temperature brine options or high delta T application.
20. Minus-One-Pass Cooler:  
Unit shall be equipped with minus-one-pass cooler heads with reduced water-side pressure drop for series flow dual chiller control or high chilled water flow applications.
21. High Ambient Temperature:  
Unit shall be equipped with high speed condenser fan motors to improve performance at high ambient temperatures. This option shall be required for 30XA400-500 chillers which are operating in multi-chiller configurations or have ambient temperatures at or above 100 F (37.8 C).
22. Security Grilles:  
Unit shall be provided with factory (or field) installed painted grilles to protect the condenser, cooler and compressor.
23. Upper Hail Guard:  
Unit shall be equipped with a factory-installed option consisting of louvered panels on the ends of the machine which firmly fasten to the machine frame. These panels shall cover the unit from the top to the bottom of the coils, thus providing protection of the coils from hail damage.
24. Full Hail Guard:  
Unit shall be equipped with field-installed accessory consisting of hinged, louvered panels,

- which cover both ends of the unit. This accessory provides complete protection from hail.
25. Full End Screen:  
Unit shall be equipped with a factory-installed option consisting of louvered panels that cover the machine ends from top to bottom and firmly fasten to the machine frame. These end screens function as a privacy screen and also provide hail protection.
26. Low Sound Package:  
Unit shall be provided with sound attenuation package to include sheet metal enclosures with sound absorbing panels for each compressor.
27. Remote Cooler Kit:  
Allows remote installation of the cooler.
28. Minimum Load Control:  
Unit shall be equipped with microprocessor-controlled minimum load control that shall permit unit operation below the minimum standard operation (varies by unit size).
29. External Pump Control:  
This field-installed accessory shall be required to provide control of dual, external pumps. This accessory shall not be required for single, external pumps or factory-installed pumps.
30. Dual Chiller Accessory Kit:  
For dual chiller applications, unit shall be provided with the additional hardware (thermistors, wells, connectors) required for proper system operation.
